Best practice in innovative electroplating plants and processes – Research and development for industrial electroplating

Martin Metzner

Fraunhofer Institute for Manufacturing Engineering and Automation IPA, Head of department electroplating, Stuttgart, Germany

martin.metzner@ipa.fraunhofer.de

In this speech, first a short impression about the applied, close to the industry working R+D in Germany will be given. Second, some project examples will show innovations in electroplating.

The Fraunhofer-Gesellschaft is the leading organization for applied research in Europe. Its research activities are conducted by 72 institutes and research units at locations throughout Germany. The Fraunhofer-Gesellschaft employs a staff of more than 25,000, who work with an annual research budget totaling 2.3 billion euros. Of this sum, almost 2 billion euros is generated through contract research. Around 70 percent of the Fraunhofer-Gesellschaft’s contract research revenue is derived from contracts with industry and from publicly financed research projects. International collaborations with excellent research partners and innovative companies around the world ensure direct access to regions of the greatest importance to present and future scientific progress and economic development.

Industrial electroplating itself is build up from two different business models: the job platers and the in house platers. Successful project examples with partners from both areas will show how innovation can be achieved in the field of electroplating. This comes up in first examples from new layer materials like alloys or dispersion coatings. Another example will show how a well known layer material like hard chromium can be plated in a smart structured way to strongly support new technologies like the production of carbon fibre reinforced composites (CFK). Examples from plating plants will show how electroplating is handled in a high level, compliant to the highest standard of regulations way, safe for the environment and workers. Finally, examples will also show how energy and material efficiency in industrial electroplating can be improved significantly supported from applied research.
