Short Communication

Antinociceptive activity of *Avicennia officinalis*

IZ Shahid, F Ahmed*, D Karmakar and SK Sadhu

*Pharmacy Discipline, Khulna University, Khulna-9208, Bangladesh*

SUMMARY

The crude ethanol extract of leaves of *Avicennia officinalis* Linn. (Family: Avicenniaceae) was screened for its antinociceptive activity. The extract produced significant writhing inhibition in acetic acid-induced writhing in mice at the oral dose of 250 and 500 mg/kg body weight ($P < 0.001$) comparable to the standard drug diclofenac sodium at the dose of 25 mg/kg of body weight. The result tends to suggest the antinociceptive activity of the extract.

Key words: Antinociceptive; *Avicennia officinalis*; Avicenniaceae

INTRODUCTION

*Avicennia* (A.) *officinalis* Linn. (family: Avicenniaceae) (synonym- *Avicennia tomentosa* Willd.), commonly known as Baen or Kala baen, is a long tree widely distributed in Coast forests of Bengal, Myanmar, mangrove forests of China and Japan. The roots possess aphrodisiac properties. The unripe seeds are used as poultice and for small pox. The bark is astringent (Kirtikar and Basu, 1987). Although a number of chemical investigations have been performed and some constituents have been reported as alkaloids, carotenoids, flavonoids, glycosides, lipids, triterpines, polyphenols, saponins, etc. (Ghosh et al., 1985; Basak et al., 1996; Sharma and Garg, 1996), no biological work has been reported on *Avicennia officinalis*. The objective of the present study was to investigate the antinociceptive activity of the crude ethanol extract of the leaves of *A. officinalis*.

MATERIALS AND METHODS

**Plant material collection and extraction**

The leaves of *A. officinalis* were collected from the Sundarbans’ Mangrove Forests, Bangladesh in August 2004, and were taxonomically identified by experts at the Bangladesh National Herbarium (accession number: 30556). About 400 g of powdered leaves were taken in a clean, flat-bottomed glass container and soaked in 1,300 ml of 80% ethanol. The container with its contents was sealed and kept for a period of 7 days accompanying occasional shaking and stirring. The whole mixture then underwent a coarse filtration by a piece of cotton followed by a filtration through Whatmann filter paper and the filtrate thus obtained was concentrated using a rotary evaporator (Bibby RE200, Sterilin Ltd., U.K.) to get the crude extract.

**Drugs**

Diclofenac sodium (Opsonin Chemical Industries Ltd, Bangladesh)
Preliminary phytochemical analysis
The crude extracts were subjected to preliminary phytochemical screening for the detection of major chemical groups. In each test 10% (w/v) solution of the extract in ethanol was used unless otherwise mentioned in individual test (Evans, 1989; Ghani, 1998).

Animals
Young Swiss-albino mice of either sex, weighing 20 - 25 g, purchased from the Animal Research Branch of the International Centre for Diarrhoeal Disease and Research, Bangladesh (ICDDR, B) were used for the test. The animals were kept at animal house (Pharmacy Discipline, Khulna University) for adaptation after their purchase under standard laboratory conditions (relative humidity 55 - 65%, room temperature 25.0 ± 2.0°C and 12 h light-dark cycle) and fed with standard diets (ICDDR, B formulated) and had free access to tap water.

Antinociceptive activity
Antinociceptive activity of the crude extract was tested using the model of acetic acid-induced writhing in mice (Whittle, 1964; Ahmed et al., 2004). The experimental animals were randomly divided into four groups, each consisting of ten animals. Group I was treated as ‘control group’ which received 1% (v/v) Tween-80 in water at the dose of 10 ml/kg of body weight; group II was treated as ‘positive control’ and was given the standard drug diclofenac sodium at dose of 25 mg/kg of body weight; group III and group IV were test groups and were treated with the extracts at dose of 250 and 500 mg/kg of body weight respectively. Control vehicle, standard drug and extracts were administered orally, 30 min prior to acetic acid (0.7%) injection. Then after an interval of 15 min, the number of writhes (squirms) was counted for 5 min.

Statistical analysis
Student’s t-test was used to determine a significant difference between the control group and experimental groups.

RESULTS

Preliminary phytochemical analysis
Results of different chemical tests on the ethanol extract of A. officinalis showed the presence of steroids, tannins, saponins, gums and reducing sugar (Table 1).

Antinociceptive activity

Table 2 showed the effect of the ethanol extract of A. officinalis on acetic acid induced writhing in mice. At the dose of 250 and 500 mg/kg of body weight, the extract produced about 41 and 55% writhing inhibition in test animals, respectively. The results were statistically significant \((P < 0.001)\) and were comparable to the standard drug diclofenac sodium, which showed 63% writhing inhibition at the dose of 25 mg/kg \((P < 0.001)\).

**DISCUSSION**

Since A. officinalis belongs to the coastal forests, part of the plant constituents may be polar in nature. Ethanol was used which has a wide range of solubility in both polar and nonpolar region. To avoid any solvent effect on the experimental animals, the solvent was evaporated completely to dryness.

Antinociceptive activity of the ethanol extract of A. officinalis was tested by acetic acid-induced writhing model in mice. Acetic acid-induced writhing model represents pain sensation by triggering localized inflammatory response. Acetic acid, which is used to induce writhing, causes algesia by liberation of endogenous substances, which in turn excite the pain nerve endings (Taesotikul et al., 2003). Increased levels of PGE\(_2\) and PGE\(_2\) in the peritoneal fluid have been reported to be responsible for pain sensation caused by intraperitoneal administration of acetic acid (Derardt et al., 1980). The extract produced significant writhing inhibition comparable to the standard drug diclofenac sodium (Table 2). The polar compounds present in the plant extract may be responsible for the obtained antinociceptive activity.

Based on this result it can be concluded that the ethanol extract of A. officinalis might possess antinociceptive activity. However, further studies are necessary to find out the active principles responsible for this activity.
