

# Preoperative Medical Treatment of Congenital Heart Disease

인천길병원 심혈관센터 소아심장과 정미진

## I. Congestive Heart Failure ( CHF )

### Definition

A clinical syndrome in which the heart is unable to pump enough blood to the body to its needs, to dispose of venous return adequately, or a combination of the two.

### Etiology

- .volume overload, pressure overload, and myocardial insufficiency
- .time of onset varies:

Table. 1  
Causes of CHF from Congenital Heart Disease

Age of onset	Cause
At birth	HLHS Volume overload lesions ; severe tricuspid or pulmonary insufficiency large systemic AV fistula
First week	TGA PDA in small premature infants HLHS TAPVR, especially pul. venous obstruction Critical AS, PS
1 - 4 wk	COA with associated lesion Critical AS large VSD, PDA in premature infants
4 - 6 wk	left to right lesions
6 wk - 4mo	large VSD, PDA anomalous left coronary a from PA

### Clinical manifestations

#### Symptom :

infants : poor feeding, tachypnea that worsens during feeding,  
poor weight gain, weak crying, cold sweat  
older children : shortness of breath (dyspnea) with activities

#### Sign :

tachycardia, cardiomegaly, hepatomegaly, puffy eyelids

### Adaptive mechanisms

- ① ventricular dilatation
  - ↑ end-diastolic volume → ↑ S.V.
  - but wall tension ↑ → ↑ myocardial O<sub>2</sub> demands
- ② ventricular hypertrophy;
  - pressure overload → heart wall을 thickening 시킴.
  - end stage에 가면 dilate
  - subendocardial region : underperfusion 되기 쉬움.
  - contractile state : normal과 failing myocardium의 중간상태
- ③ Adrenergic mechanisms
  - increased plasma concentration and urinary excretion of NE, Epi
  - ↑  $\beta$ -adrenergic function : ↑ in myocardial contractility and heart rate.
  - ↑  $\alpha$ -adrenergic function : redistribution of cardiac output
    - ↑ to heart, CNS
    - ↓ to kidney, G-I, skin
- ④ Regional circulations
  - pulmonary dynamics : interstitial edema(tachypnea) → alveolar edema(rale, wheeze)
  - renal mechanisms :
    - a) constriction of efferent glomerular arteriole and increased renal vascular resistance
      - greater fraction of plasma to be filtered
      - ↓ postglomerular hydrostatic pressure and ↑ postglomerular oncotic pressure
      - ↑ peritubular capillary uptake of proximal tubular fluid (Na)
    - b) renin release
      - angiotensin I → angiotensin II → aldosterone → Na reabsorption ↑
  - ⑤ Erythrocyte oxygen transport
    - rt shift of oxyhemoglobin dissociation curve via 2,3-DPG
      - ↑ oxygen unloading capacity
  - ⑥ Atrial natriuretic factor (ANF)
    - role in volume and pressure regulation

#### Treatment

- 1. contents :
  - elimination of underlying cause
  - elimination of precipitating causes (infection, fever, anemia)
  - control of heart failure state
- 2. general measures;
  - oxygen(40–50%) with humidity
  - sedation : morphine or phenobarbital (occasionally, 1–2일 간)
  - daily weight measurement
  - salt restriction : not indicated in infants.
    - older children (<0.5g/day)

3 Drug therapy

1) Diuretics

Table. 2 classification of diuretics

preparation	route	Dosage
Thiazide Diuretics		
Chlorothiazide (Diuril)	oral	20-40 mg/Kg/D # 2-3
Hydrochlorothiazide (Hydrodiuril)	oral	2-4mg/Kg/D # 2-3
Loop diuretics		
Furosemide (Lasix)	IV	1mg/Kg/dose
	oral	2-3mg/Kg/D # 2-3
Ethacrynic acid (Edecrine)	IV	1mg/Kg/dose
	oral	2-3mg/Kg/D # 2-3
Aldosterone antagonist		
Spironolactone (Aldactone)	oral	2-3mg/Kg/D # 2-3

side effect :

- hypokalemia, (except with aldactone)
- hypochloremic alkalosis : loss of chloride
- ↑ digitalis toxicity

2) Digitalis glycosides

\* Digitalization

P.O.dose      premature      0.02 - 0.025 mg/Kg  
 neonate (< 1mo)      0.03 - 0.04 mg/Kg  
 adolescent or adult      1.0 -1.5 mg in devided dose  
 digitalization (IV) ;      75 % of p.o. dose  
 maintenance      ; 1/4 -1/3 of digitalizing dose # 2  
 oral maintenance  
     < 10 Kg      0.01 mg/Kg  
     10 - 20 Kg      0.1 + 0.005 mg/Kg over 10  
     20 -30 Kg      0.15 + 0.0025 mg/Kg over 20

\* pharmacokinetic steady state: 3-5일 in digitization  
 5-8일 in maintenance

\* digitalis effects and toxicity

effects: shortening of QTc  
 sagging ST segment and diminished amplitude of T wave  
 slowing of heart rate

toxicity ; baseline ECG와 비교

prolongation of PR interval  
 2° AV block  
 profound sinus bradycardia or SA block  
 supraventricular arrhythmia(atrial nodal ectopic beat and tachycardia)  
 ventricular arrhythmia(PVC)

- \* monitoring for toxicity :
  - ECG
  - serum digoxin levels : therapeutic range 0.8-2.0 ng/ml
  - sampling : digitalization 후 3-5 일 지나서  
6hrs after last dose or just before  
a scheduled dose
- \* predisposing factors to toxicity
  - ① high serum level
    - drug interaction (Quinidine, verapamil, amiodarone)
    - decreased renal excretion : premature baby, renal ds
  - ② increased myocardial sensitivity
    - myocarditis, myocardial ischemia
    - electrolyte imbalance (hypokalemia, hypercalcemia)
    - alkalosis, hypoxia
- \* therapy for digitoxin toxicity
  - ① discontinuation, ECG monitoring
  - ② PVC or supraventricular arrhythmia;
    - potassium chloride 3-5g/D in fruit juice  
0.5mEq/Kg/hr IV (max. 3mEq/kg/D)
    - Clex in advanced heart block, oliguria
  - ③ tachyarrhythmia;
    - lidocaine 1mg/kg bolus - 1-3mg/kg/hr(max. 5mg/kg)
    - dilantin 3-5mg/kg IV repeat 10-15min(max. 500mg/4hrs)
    - propranolol 0.01mg/kgIV per 2min (max. 0.1mg/kg)- 1-4mg/kg/D P.O
    - DC version ; start at 0.5 joules/kg
  - ④ heart block;
    - Atropine : 0.01-0.03mg/kg per 4-6hrs (max. 0.4mg/kg)
    - transvenous pacing
  - ⑤ digibind(digoxin immune fab) : in accidental overdose  
weight 20kg : 40mg (1V) IV for 30 min
- 3) Other inotropics
  - Epinephrine (Adrenalin ) IV 0.1 -1.0 ug/Kg/min
  - Isoproterenol (Isuprel ) IV 0.1 - 0.5 ug/Kg/min
  - Dobutamine (Dobutrex ) IV 5 -8 ug/Kg/min
  - Dopamine (Intropin) IV 5 - 10 ug/Kg/min
  - @ dose related cardiovascular effects of dopamine
    - Renal vasodilation : 2-5
    - Inotropic : 5-8
    - mild vasoconstriction : > 10
    - Vasoconstriction : 15 -20
- 4) Afterload-reducing agents
  - Ix : cardiomyopathy, postop, status, severe AR or MR
  - ① arteriolar vasodilators : propranolol과 같이 사용
    - hydralazine : (IV) 0.1-0.2mg/kg per 4-6hrs(max. 2mg/kg/dose)
    - (O) 0.75-3.0 mg/kg/D #2 or 4(max. 200mg/D)
  - ② venodilators:

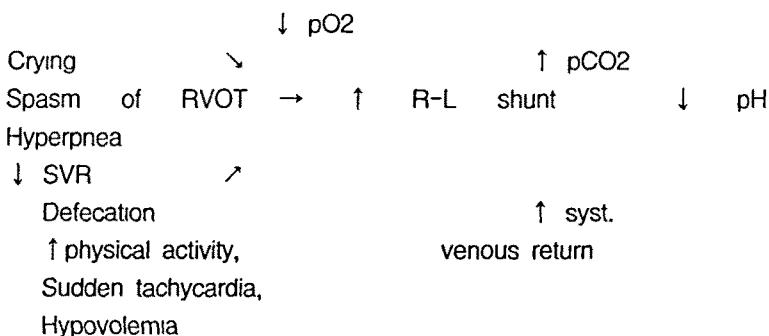

- nitroglycerin : (IV)  $0.5\text{--}2.0 \mu\text{g/kg/min}$   
 ③ balanced vasodilators; (postop rise in PA pressure에 사용)  
 captopril : (O)  $0.5\text{--}6.0 \text{mg/kg/d. #1-4}$   
     12.5mg, 1-2번 in child  
 enalapril : (O)  $0.1 \text{mg/kg, 1-2번/D}$   
 nitroprusside : (IV)  $0.5\text{--}8 \mu\text{g/kg/min}$   
 prazosine(minipress): (O)  $5 \mu\text{g/kg} \rightarrow 25\text{--}150 \mu\text{g/kg/D. #4}$

## II. Cyanosis

Definition :

a bluish discoloration of skin and mucous membrane resulting from an increased concentration of reduced hemoglobin ( $5\text{g}/100\text{ml}$ )  
 central cyanosis vs peripheral cyanosis

- 1) mechanism : vicious cycle

- 2) symptom & sign :

hyperpnea (rapid and deep respiration)  
 worsening cyanosis  
 disappearance of heart murmur  
 CNS symptom  
 death

- 3) Treatment : breaking cycle

- ① knee-chest position : ↓ systemic venous return (trap in legs)  
     ↑ SVR by reducing arterial blood flow
  - ② morphine sulfate ( $0.2 \text{ mg/kg S. C or IM}$ ) : suppress resp. center
  - ③ oxygen
  - ④  $\text{NaHCO}_3$  ( $1\text{mEq/kg IV}$ ) : reduce respiratory center-stimulating effect of acidosis
- \*\* ①-④로 full response 없으면 다음 Tx 실시.
- ⑤ Neo-synephrine ( $0.02 \text{mg/kg IV}$ ) : vasoconstrictor
  - ⑥ ketamine ( $1\text{--}3\text{mg/kg IV for 1min}$ ) : ↑ SVR, sedation
  - ⑦ propranolol ( $0.01\text{--}0.25 \text{mg/kg IV slowly}$ ): ↓ Heart rate

⑧ prevention : oral propranolol 2–6mg/kg/D #3 or 4

- \* ductus dependent CHDs에서 ductus patency를 유지하기 위해 사용.
- \* Indication
  - 1) source of pulmonary blood flow  
TGA, pulm. atresia, severe TOF, Tricuspid atresia, severe ps
  - 2) source of descending aortic flow :  
COA, hypoplastic left heart, IAA
- \* use
  - PGE1(동아제약) : 0.05 μg/kg/min로 시작, response에 따라 증감량
  - Eglandin(녹십자) : 5ng/kg/min로 시작.  
response : PaO<sub>2</sub> 증가, cyanosis 호전  
caution : light shielding
- \* side effect :  
apnea, hypotension, tachycardia, fever, irritability

### III. Intervention

#### A. Balloon atrial septostomy (BAS)

Indication :

inadequate arterial oxygen saturations despite PGE1  
TA, PA with IVS, critical PS, TGA, HLHS  
restrictive foramen ovale : diameter < 4mm

#### B. Palliative pulmonary balloon valvuloplasty

TOF : for decreasing the requiring of B-T shunt and transannular patch of RVOT reconstruction.

balloon/annulus ratio : 1.3–1.5

#### C. pulmonary valvotomy

PA with IVS

critical ps

radiofrequency catheter 혹은 wire 이용하여 balloon 시행

#### D. Stenting of ductus arteriosus

HLHS ; before cardiac transplantation

#### E. Definitive interventional techniques

① closure : ASD, VSD, PDA, collaterals (coil)

② stents : branch pulm. a. stenosis, pulm. vein stenosis

③ valvuloplasty : PS, AS
