

Production and Commercialization of Cordycepin Gelenicals

Kim Hyung-kwon, Representative of Imsil Cordycepin (Farming Corporation)

Yoon Eui-soo, Department of Biology, Gongju University

Korea's farming has posted remarkable development in many respects; however, the farming has such limitations as low investment effects resulting from limited productivity, low price competitiveness at international market and the limits of creating the value required by the changing community as the traditional concepts dubbed land, capital and labor.

Farming is an industrial which is in the edge of the environment industry and the life that can be called the main axis of the economic flow during the 21st century. It carries high potential of becoming a venture firm depending on efforts.

The success of the venture farming depends on the creation of the foundations such as the circumstances surrounding the natural resources and technologies, and the creation of personal and capital networks. In order to create a suitable environment for more active venture farming, an optimal plan should be set up to install a venture training center, convert part of public funds into venture capital, activate networking between personal resources and induce a program of fostering farming venture-related small-medium enterprises to a farming venture system.
