Generally pyrrole derivatives were mainly synthesized by treatment of amine and 2,5-dimethoxytetrahydrofuran with glacial acetic acid at high temperature. But nortropinone derivatives were obtained by treatment of amine and 2,5-dimethoxytetrahydrofuran with acetonecarboxylic acid at 0°C.

In view of this interesting result, we report the reactions of aliphatic and aromatic diamines and 2,5-dimethoxyhydrofuran with acetonedicarboxylic acid.

Synthetic products are as follows : 1,4-Di-(N-tropinonyl)benzene, 1,2-Di-(N-tropinonyl)ethane, 1,3-Dipyrrolylbenzene, etc.
