

## 탄화수소/산소 혼합기체가 채워진 관 내부를 전파하는 데토네이션 파의 해석과 가시화

최정열 교수

부산대학교 항공우주공학과

---

A numerical study is carried out on the detonation wave propagation through a T-shaped flame tube, which represents a crucial part of the combustion wave ignition (CWI) system aimed for simultaneous ignition of multiple combustion chambers by delivering detonation waves. The formulation includes the Euler equations and an induction-parameter model. The reaction rate is treated based on a chemical kinetics database obtained from a detailed chemistry mechanism. A second-order implicit time integration and a third-order TVD algorithm are implemented to solve the theoretical model numerically. A total of more than two-million grid points are used to provide direct insight into the dynamics of the detonation wave. Several important phenomena including detonation wave propagation, degeneration, and re-initiation are carefully examined. Information obtained can be effectively used to facilitate the design and optimization of the flame tubes of CWI systems.

## Numerical analysis and visualization of a detonation wave propagating through a Hydrocarbon/Oxygen mixture

Jeong-Yeol Choi  
Pusan National University

Aerospace Propulsion/Combustion Lab. 2004 KSV Spring Meeting, Seoul Nat'l Univ., Korea, April 23, 2004, 1-42

## Contents

- Introduction to Detonation wave phenomena
- Background of IPM(Induction Parameter Modeling)
- Induction time database from CHEMKIN-II
- Correlation of induction time
- Implementation and Applications
  - 1D theoretical formulation detonation dynamics results
  - 2D validation & detonation wave front dynamics
  - Detonation wave dynamics through T-branched tube
- Conclusions

Aerospace Propulsion/Combustion Lab. 2004 KSV Spring Meeting, Seoul Nat'l Univ., Korea, April 23, 2004, 2-42

## What is Detonation ?

- Detonation <sup>1</sup>An explosion or sudden report made by the instantaneous decomposition or combustion of unstable substances' as, the detonation of gun cotton.(Webster) <sup>2</sup> a violent release of energy caused by a chemical or nuclear reaction [syn: explosion] (WordNet)
- Detonation Wave = Coupled shock and combustion wave
- Examples
  - Bomb Explosion
  - Explosion in coal mine and granary
  - Daegu subway disaster (Equivalent to TNT 54t, 1995.4.28)
  - Aerospace propulsion systems (Pulse Detonation Engine, Ram Accelerator, Combustion Wave Igniter)

Aerospace Propulsion/Combustion Lab. 2004 KSV Spring Meeting, Seoul Nat'l Univ., Korea, April 23, 2004, 3-42

## Daegu subway disaster

## Combustion Phenomena

Combustion Phenomena	Diffusive	Premixed
Wave Stationary	Candle Flame	Gas-Range
Geo-Stationary	Diesel Engine	Gasoline Engine

- Premixed Combustion : Detonation Wave & Deflagration Wave(flame)

## Detonation Wave Structure

	Detonation	Deflagration
$u/c_1$	5-10	0.0001-0.03
$u_2/u_1$	0.4-0.7 (decel)	4-6 (acc)
$p_2/p_1$	13-55 (comp)	-0.98 (expan)
$T_2/T_1$	8-21	4-16
$\rho_2/\rho_1$	1.7-2.6	0.06-0.25

- ZND Structure
  - Zel'dovich-Neumann-Döring
  - Thin Combustion zone behind a Shock Wave
  - Coupled Shock and Reaction Wave

## Propagating Detonation Wave

- Unsteadiness
  - Instability Characteristics by Chemical Kinetic
  - Exponential Growth or Decay of Reaction Rate

$$w_k = M_k \sum_{r=1}^{N_r} (v_{kr} - v_{kr}) \left( k_{fr} \prod_{k=1}^N \left( \frac{P_k}{M_k} \right)^{\nu_{kr}} - k_{br} \prod_{k=1}^N \left( \frac{P_k}{M_k} \right)^{\nu_{kr}} \right) \cdot k_{fr} = A_{fr} T^{\beta_{fr}} e^{-E_{fr}/T}$$

- 1-D Characteristics
  - Oscillating Characteristics around C-J Condition
  - Galloping Detonation Wave (Pulsating Detonation Wave)

## Multi-Dimensional Structure

- Cellular Structure
- Unsteady Wave Structure

- Smoked Foil Record

- Large Scale Image

- Cell Width (Cell Size)

## Detailed Wave Front

- Fully 3-Dimensional Structure
- Vortex Structure behind the Wave Front

## Background of IPM

- Detonation Wave = Coupled shock and combustion wave
  - Explosion analysis and Propulsion applications
- Thermo-chemical properties that characterize the detonation wave
  - Detonation cell-size, Pressure ratio, temperature ratio
  - Amount of heat addition
  - Chemical characteristic time (induction time)
    - changes exponentially
    - Very high grid resolution to capture the broad range of induction regime.
  - Also true for many combustion dynamics problems
  - IPM : modeling of heat and induction time with reaction progress variable
- Class of Chemical kinetics Model for HC fuel combustion
  - Detailed Chemistry : ~50 species, ~300 reaction steps
  - Reduce Chemistry : ~20 species, ~30 reaction steps
  - Global Chemistry : 5 species, 1-4 steps
  - Reaction progress variable modeling : 1-2 variables, 1 step

## Computational Costs for Kinetics

- Computational Cost for CFD/chemical kinetics calculations at P!!! 650MHz

Fluid dynamics/ Kinetics Model	#S/iter/node
Non-Reacting flow	9.60
Non-Reacting flow + 1 more conservation equation	12.73
Reaction Progress variable modeling : Non-Reacting flow + 1 more conservation equation with exponential source term	16.01
Global Chemistry : 5 species and 1 step kinetics for CH4/Air	30.53
Detailed Chemistry : 9 Species and 19 steps kinetics for H2/Air	80.40
Reduced Chemistry : 22 species and 34 steps kinetics for CH4/Air	233.06
Detailed Chemistry for HC	N/A

- Motivation ! - Accurate Induction Parameter (reaction progress variable) Modeling based on induction time database calculated by detailed kinetics mechanisms.

## Construction of Induction Time Database

- Selected fuel : Cracked JP-7 in catalytic reactor

Component	H <sub>2</sub>	CH <sub>4</sub>	C <sub>2</sub> H <sub>6</sub>	C <sub>3</sub> H <sub>8</sub>
mass fraction, y <sub>i</sub>	0.005	0.383	0.293	0.319
mole fraction, x <sub>i</sub>	0.052	0.503	0.205	0.240

- Detonation Characteristics : NASA CEA
  - Temperature : 250-500 K, Pressure : 0.1-100 bar, Equivalence ratio : 0.6-1.8
- Induction time calculation with Chemkin-II and GRI-Mech. 3.0
  - Shocked temperature : 900-1800 K
  - Shocked pressure : 0.1-1000 bar

## Examples of Induction Time Calculation

## Induction Time Summary

- Equivalence ratio = 1.23 (O/F=3.04)

## Induction Parameter Model

- Curve-fit of induction time database

- Two-dimensional Least-square methods

$$\tau^*(T, p) = \exp\left(A^*(p) + \frac{E^*(p)}{T - T^*(p)}\right)$$

where,  $A^*(p)$ ,  $T^*(p)$  and

$$E^*(p) = a_0 + a_1 \log p + a_2 (\log p)^2 + a_3 (\log p)^3$$

- Induction parameter modeling

$$\frac{dZ}{dt} = w(Z) = \frac{1}{\tau(T, p)} \quad w_{max} = \frac{1}{\tau^*(T, p)}$$

- Assumption : locally quadratic approximation

$$w(Z) = \frac{C}{f'(Z)} \exp(-f(Z))$$

$$\frac{dZ}{dt} = w(Z) = C \frac{(T - T^*(p))}{E^*(p) T_i} \exp\left(-A^*(p) - \frac{E^*(p)}{T - T^*(p)}\right), \quad C = \frac{4T_i}{E^*} \text{ or } C=1$$

## IPM Validation

## One-D Formulation

$$\frac{\partial}{\partial t} \begin{bmatrix} \rho \\ \rho u \\ \rho e \\ \rho Z \end{bmatrix} + \frac{\partial}{\partial x} \begin{bmatrix} \rho u \\ \rho u^2 + p \\ (\rho e + p)u \\ \rho Zu \end{bmatrix} + \frac{\alpha}{x} \begin{bmatrix} \rho u \\ \rho u \\ (\rho e + p)u \\ \rho Zu \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$e = \frac{R(Z)}{\gamma(Z)-1} T + \frac{1}{2} u^2 - Zq$$

$$\rho = \rho R(Z) T$$

$$R(Z) = R_g(1-Z) + R_b Z$$

$$\gamma(Z) = \frac{Y_g(\gamma_g - 1)(1-Z) + Y_b(\gamma_b - 1)Z}{(Y_g - 1)(1-Z) + (Y_b - 1)Z}$$

$$w = \frac{(T - T^*(p))}{E^*(p)T_g} \exp\left(-A^*(p) - \frac{E^*(p)}{T - T^*(p)}\right)$$

- TVD upwind discretization – AUSM+Roe, MUSCL
- 4<sup>th</sup> order Runge-Kutta time stepping
- Thermo-chemical parameters from NASA CEA or Rankine-Hugoniot relation

Aerospace Propulsion Combustion Lab.

2004 KSI Spring Meeting, Seoul Nat'l Univ., Korea, April 23, 2004, 19-42

## Detonation Propagation

- Cracked JP-7/oxygen mixture

$$T = 400 \text{ K}, p = 1 \text{ MPa and } \phi = 1.23 (\text{O/F}=3.04)$$

- Chapman-Jouguet (C-J) detonation properties from CEC

$$- p/p_1 = 26.884, T/T_1 = 10.672, \rho/\rho_1 = 1.8384, \text{ and } V_{CJ} = 2580.1 \text{ m/s}$$

- Unburned and burned gas properties

$$- \gamma_u = 1.2992 \text{ and } R_u = 293.23 \text{ J/kgK}$$

$$- \gamma_b = 1.1484 \text{ and } R_b = 401.79 \text{ J/kgK}$$

$$- q = 1.0422 \times 10^7 \text{ J/kg}$$

- Satisfy Rankine-Hugoniot relation

2004 KSI Spring Meeting, Seoul Nat'l Univ., Korea, April 23, 2004, 24-42

## Two-D Formulation

$$\frac{\partial}{\partial t} \begin{bmatrix} \rho \\ \rho u \\ \rho v \\ \rho e \\ \rho Z \end{bmatrix} + \frac{\partial}{\partial x} \begin{bmatrix} \rho u \\ \rho u^2 + p \\ \rho uv \\ (\rho e + p)u \\ \rho Zu \end{bmatrix} + \frac{\partial}{\partial y} \begin{bmatrix} \rho v \\ \rho uv \\ \rho v^2 + p \\ (\rho e + p)v \\ \rho Zv \end{bmatrix} + \frac{\alpha}{y} \begin{bmatrix} \rho v \\ \rho uv \\ \rho v^2 \\ (\rho e + p)v \\ \rho Zv \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- TVD upwind discretization – AUSM+/Roe, MUSCL
- Fully-implicit second order time integration
  - Newton sub-iteration, LU-relaxation scheme
  - is computationally efficient by larger time step.
  - is triggering earlier the wave front instability.

## Shock-Induced Combustion

$M = 7.0$ ,  $p = 0.1$  MPa,  $T = 400$  K  
80x80 grid,  $R = 20$   $\mu$ m

## Two-D Detonation Wave

- Cracked JP-7/oxygen mixture
  - $T = 400$  K,  $p = 1$  MPa
  - $\phi = 1.23$  (O/F=3.04)
- C-J properties as I.C.
  - $p/p_1 = 26.884$
  - $T/T_1 = 10.672$
  - $\rho/\rho_1 = 1.8384$
  - $U_{\text{det}} = 2,590$  m/s
- Computational domain
  - $20$   $\mu$ m  $\times$   $30$   $\mu$ m
  - 500x600=300,000 grid points
  - CFL = 1.0

## Wave Front Dynamics

## Wave Front Dynamics (cont'd)

## Two-D Cell Structure

Cell width = 5 ~ 10  $\mu$ m

### Wave Front History

- Pressure oscillation between 35 – 100 MPa.
- Oscillation frequency is approximately 100 MHz.
- Two-dimensional detonation wave speed is 2,920 m/s
  - 1% higher than the C-J detonation speed.
- Irregular cell structure, cell width ranges from 5 to 10  $\mu\text{m}$ .

### Detonation Propagation in T-branch

### Conclusions

- Development of IPM (induction parameter modeling) PROCEDURE.
  - Based on detailed kinetics mechanisms
  - Applied for Hydrocarbon fuel/Oxidizer mixture
  - Efficiency
  - Accuracy
- One-D code construction with IPM implementation
  - One-dimensional detonation wave propagation
  - Grid refinement study for wave front dynamics
- Time efficient two-D code construction with IPM
  - Two-dimensional detonation wave simulations
  - Investigation of Detonation wave Propagation in T-branched tubes
- Further applications are expected.
  - Other fuel/Oxidizer mixture
  - Other combustion phenomena (premixed combustion including detonation)

Aerospace Propulsion/Combustion Lab. 2004 KSV Spring Meeting, Seoul Nat'l Univ., Korea, April 23, 2004, 42-42
