

Application of Mini-Dental implant for ongoing implant therapy; A clinical presentation for partially and completely edentulous patients

배은경*, 이영아, 정소현, 한동후 | 연세대학교 치과대학 보철학교실

Implant treatments are now important part of routine dentistry. With improvements in success rate, dental clinicians faces more challenging situations. Where many advanced skills and reliable techniques allow treatment of these with excellent results. However, in ridges with insufficient mesio-distal space even after orthodontic treatment and narrow ridges without complex bone augmentation, present limitations for regular sized implants.

Use of mini-implants in these situations have been discussed in literatures.

This case presentation presents successful treatments of anterior edentulous spaces with insufficient mesio-distal space and narrow mandibular ridge treated with Sendax long term Mini implant system for replacing single prosthesis and implant retained overdenture.
