

심장핵의학 분석 응용 프로그램의 원리와 특징

전남대학교 의과대학 핵의학교실
이 병 일

내 용

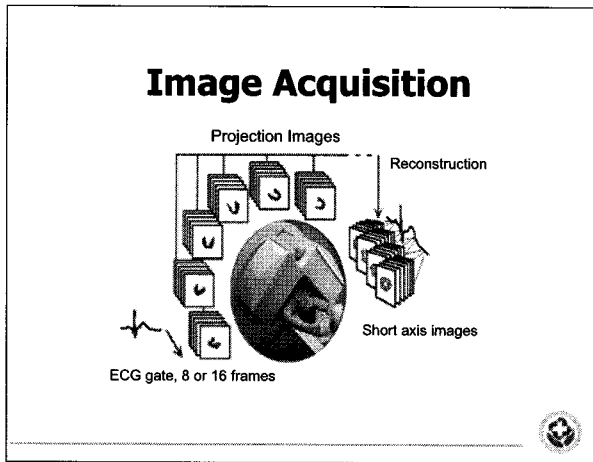

- 심장 핵의학 영상검사의 원리
- 분석용 프로그램의 종류
- 심장 기능 정량화 기법
- 응용 프로그램의 임상적평가

심장핵의학 영상검사의 원리

Nuclear Cardiology

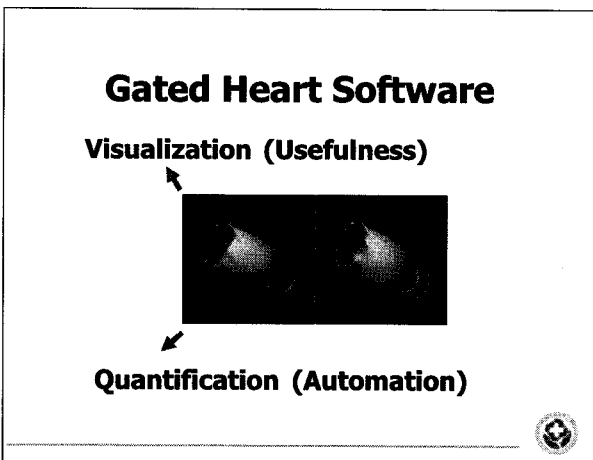

- To detect disease – CAD
- To define the extent of disease which is usually synonymous with risk stratification and prognosis
- To predict the outcome of therapeutic procedures
- To monitoring response to treatment, usually revascularization

- ### Myocardial SPECT
- Gated Myocardial SPECT
 - Analysis of anatomical, biological states
 - Functional nuclear medicine imaging tool
 - Perfusion of myocardium
 - Ischemia, Infarction
-

분석용 프로그램의 종류

- ### Software for Cardiac Study
- **QGS**
 - Quantitative Gated SPECT
 - Cedars-Sinai Medical Center
 - Los Angeles, CA
 - **ECT**
 - Emory Cardiac Toolbox
 - Emory University
 - Atlanta, GA
 - **4D-MSPECT**
 - University of Michigan Medical Center
 - Ann Arbor, MI
 - **pFAST**
 - Perfusion and Functional Analysis for Gated SPECT
 - Sapporo Medical University
 - Sapporo, Japan

QGS, QPS

- QGS (Quantitative Gated SPECT)
- Interactive standalone application for the automatic segmentation, quantification, and analysis and display of static and gated short axis myocardial perfusion.
- QPS (Quantitative Perfusion SPECT)
- Automatic generation of optimal perfusion normal limits from a normal, a prospective and a pilot patient population.

ECToolbox

4D-MSPECT

심장기능 정량화 기법

Perfusion image

Figure C.3 Normal Case (RanoCa) - Static Display: Gridview

Figure C.4 Normal Case (RanoCa) - Polar Map Display: Window
y arrows in Figure C.4 indicate area of decreased tracer uptake on Rest.

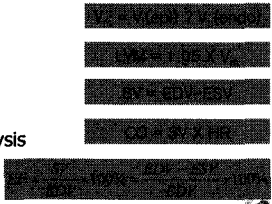

Function image

Cardiac Index

- Global LV Functions
 - Ejection Fraction
 - Volume of End-systolic and End-diastolic phase
 - LVM
- Regional LV Functions
 - Wall Motion
 - Wall Thickening
- Developing Functions
 - LV Diastolic Phase Analysis
 - RV Estimation

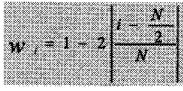

LV Segmentation(1)

- Threshold Based
 - LV Dynamic Thresholding
 - Thresholding based on discriminant analysis
- Edge-Based Techniques
 - Wavelet-Based LV Edge Detection
 - Gradient Based
 - Statistical-Based Matched Filtering
 - LV Detection Based on AI
- Mathematical Morphology-based Techniques

LV Segmentation(2)

- Germano
 - Threshold to 50% of C_{max}
 - Binary clustering
 - Hough transform extension(local maxima of summed slice)

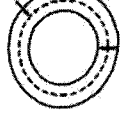

$$W_{ij} = 1 - 2 \frac{i}{N} - \frac{j}{N}$$

- 50% threshold inside the cylinder and 3-D scan from COM(10°)
- An asymmetric Gaussian is fitted to each profile

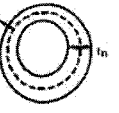

Estimating Boundaries for Additional Gates

Since the myocardial thickness at end diastole is presumed to be uniformly 10 mm, the percent thickening information can be used to approximate "absolute" myocardial thickness at each sampled point in the LV of every gated frame. Once again, endocardial and epicardial boundary points can be determined by subtracting and adding, respectively, of the myocardial thickness to the myocardial center, respectively. These operations result in a set of endocardial and epicardial surface points, corresponding to each quantitated perfusion sample, for all frames in the cardiac cycle. The modeling procedure is shown in Figure 3-9.

Frame 1

Frame n

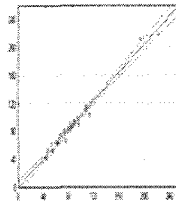

c_n = myocardial center points at frame n
 t_n = myocardial thickness at frame n
 $r_{1n} = r_1 + t_n \cdot \cos(\theta_{endocardial} + \theta)$
 $r_{2n} = r_2 + t_n$
 $r_{1n} = r_1 + t_n$
 $r_{2n} = r_2 + t_n$

Figure 3-9 Modeling Procedure Provides a set of Endocardial and Epicardial Surface Points Which Correspond to Each Quantitated Perfusion Sample, for all Frames in the Cardiac Cycle.
