Jehun Choi, Eun-Suk Lee and Young-Chul Kim

Objectives

Investigation of anti-inflammatory activity of plant resources and their utility

Materials and Methods

○ Materials

Plant extracts for the study including *Agastache rugosa* O. Kuntz extract have been provided from Plant Extract Bank (PJ007083201003 & PJ 007437201003) of NIHHS, RDA.

○ Methods

- Cell line for the study was RAW264.7 cell, which was incubated in culture medium of Dulbecco's Modified Eagle Medium (DMEM) with 10% fetal bovine serum (FBS), 100 U/mL penicillin, 100 mg/mL streptomycin in condition of 37° C and 5% CO₂. Final concentration of the extract samples dissolved in dimethyl sulfoxide (DMSO) were 5 µg/ml in the cell culture system.
- Assay of TNF-α and IL-6 secretion have been conducted on the supernatant of RAW264.7 cell culture system after treatment or no-treatment of sample and/or 100 ng/mL of LPS with enzyme-linked immunosorbent assay (ELISA) kit (eBioscience, San Diego, CA, USA).
- Assay of Iκ-Bα, iNOS and COX-2 expression in RAW264.7 cells have been done by electrophoresis method after treatment against Iκ-Bα, iNOS, COX-2 specific antibodies, then horseradish peroxidase (HRP, secondary antibodies), and subsequently with chemiluminescence reagents (Amersham Biosciences, Piscataway, NJ, USA), respectively.

Results

From the results, rhizome of *Alpinia officinarum*, fruit peel of *Citrus unshiu* and flower of *Inula britannica* var. *chinensis* have ameliorated the reduction of iκ-Bα expression, and trunk peel of *Ulmus arvifolia*, root of *Gastrodia elata* have reduced iNOS expression. *Agrimonia pilosa* L. var. *japonica* (stem and leaf), *Gossyium nanking* (seed), *Lysimachia vulgaris* var. *davurica* (aerial part), *Lithospermum erythrorhizon* (root) and *Aster scaber* (aerial part) have showed effective inhibition activity on TNF-α, IL-6 secretion. We suggest that these plants would be studied the utility as anti-inflammation materials through further research.
