

POLYCHAETOUS ANNELIDS GROWING IN OYSTER FARMS**

Eui-In PAIK*

굴 양식장 수하연에 부착하는 다모환충류의 분류학적 연구**

백 의 인*

부착 생물에 관한 연구는 선박, 해수 이용시설, 수산 양식업 등의 방제대책과 관련하여 부착 생물의 종류, 부착 량, 성장도 및 계절적 변화 등의 연구가 중요한 문제라고 생각한다. 특히 양식시설이 밀집한 진해만 해역의 굴 양식 시설에 부착하는 대부분의 생물들이 Ascidacea, Crustacea, Cirripedia, Bivalvia, Bryozoa, Polychaeta, marine algae 등이며, 이들 가운데 피해가 심한 다모환충류에 관하여 분류학적인 연구를 시도하였던 바 수하연의 양식 굴 사이에서 많은 양의 깃지렁이류를 일었기에 보고 한다.

수하연에 서식하는 깃지렁이류는 제2부착성(Kazihara, 1964)의 깃지렁이류로서 왕관 모양의 큰 아가미 혹은 몸앞 부분에 실모양의 갑각 촉수를 가지고 굴에 피해를 입히는 짧은수술깃지렁이 *Loimia medusa*, 미끈꽃깃지렁이 *Myxicola infundibulum*와 제1부착성으로서 굴 폐각, 양식 시설 등에 석회질의 집을 형성시켜 피해를 입히는 우산판덮개꽃깃지렁이 *Hydroides ezoensis*, 둥근구멍판덮개꽃깃지렁이 *Dexiospira alveolatus* 등의 7과 12속 13종을 보고한다.

이 가운데 새날개깃지렁이 *Chaetopterus variopedatus*와 둥근구멍판덮개꽃깃지렁이 *Dexiospira alveolatus*는 한국 미기록종이다.

INTRODUCTION

This paper is concerned with polychaetous annelids growing on the oyster cultches farmed by the hanging method in Chinhae Bay in the southeastern part of Korea.

The principal external diagnostic characters of all the families of polychaetous annelids from oyster farms are depicted with tabulated scheme, and taxonomical keys are presented.

Thirteen species representing twelve genera are described. Of these, two species representing two families are newly added to the polychaetous annelids fauna of Korea.

Consequently, it totals 130 species of polychaetous annelids from Korea including those previ-

ously reported (Kamita and Sato, 1941; Paik, 1972, 1973a, 1973b; Rho and Song, 1974, 1975; Paik, 1975a, 1975b, 1976; Lee, 1976; Paik, 1977, 1978, 1979a, 1979b, 1979c).

CHECKLIST OF POLYCHAETOUS ANNELIDS INHABITING HANGING CULTCHES AT OYSTER FARMS IN CHINHAE BAY

POLYNOIDAE

Halosydna brevisetosa Kinberg

짧은예쁜이깃지렁이

HESIONIDAE

Hesione reticulata Marenzeller

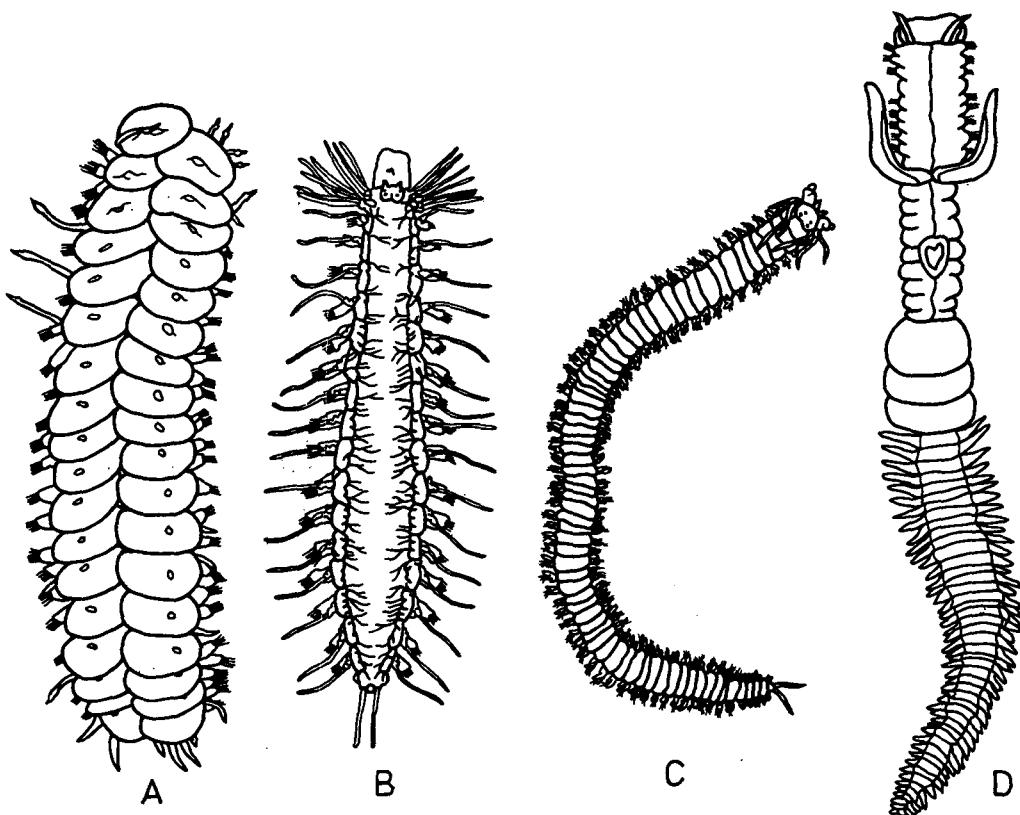

그물등수염깃지렁이

NEREIDAE

* Hyosung Women's College, Daegu, 630 Korea, 효성여자대학 생물학과

** 이 논문은 1979년도 문교부 학술연구조성비에 의하여 연구된 것임.

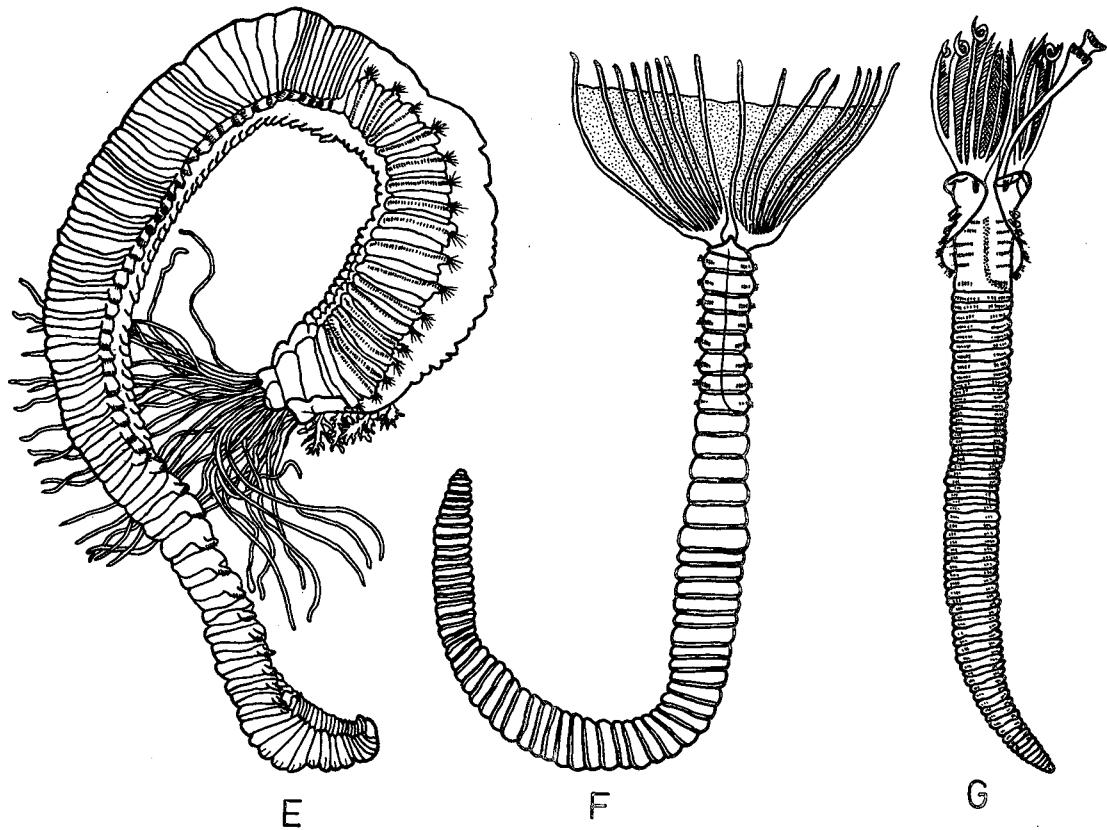

Table 1. Principal external diagnostic characters of families

Family	Appendages of the anterior end	Setae
POLYNOIDAE Table 1, fig. A Page 37 ; Fig. 1a-b	3 ant 1 pair palps 2 pair tC	notosetae spl neurosetae spl
HESIONIDAE Table 1, fig. B Page 37 ; Fig. 1c	2 ant 0 pair palps 8 pair tC	notosetae absent neurosetae cpd

SERPULIDAE Table 1, fig. G Page 39 ; Fig. 2e-i	tC crown opercula crown	notosetae spl neurosetae avical

ant, antenna; cpd, compound seta; spl, simple seta; tC, tentacular cirrus.

Polychaetous annelids growing in oyster farms

Other diagnostic characters

Dorsal cirrus well developed, flattened and leaflike, sometimes nearly covering dorsum

Proboscis muscular

With 2 large dark jaws

Body has 3 regions

All notosetae limbate capillaries
branchia is simple filament
tube made of sand and shells

All notosetae limbate capillaries
mucous tubes

Calcareous tubes

<i>Perinereis nuntia</i> (Savigny)	눈썹참갯지렁이	fig. A; Fig. 1a, b)POLYNOIDAE
<i>Neanthes japonica</i> (Izuka)	참갯지렁이	1. Without these horizontal scales.....2
<i>Nereis neoneanthes</i> Hartman		2. 8 pairs of tentacle-cirri; Very long dorsal cirri (as Table 1, fig. B; Fig. 1c)HESIONIDAE
	큰깨점박이참갯지렁이3
<i>Nereis multignatha</i> Imajima and Hartman	깨점박이참갯지렁이	3. Parapodia biramous with tungs, lips and cirri; Prostomium with two palps and two tentacles; Two jaws and paragnaths (Table 1, fig. C; Fig. 1d, e, f, g, h, i, j, k, l, m, n, o, p; Fig. 2a, b, c, d)NEREIDAE
CHAETOPTERIDAE		3. Setae on the most anterior segments; Body divided into three very different regions. In the medial region are the segments very much transformed(as Table 1, fig. D)CHAETOPTERIDAE
<i>Chaetopterus variopedatus</i> (Renier)	세날개갯지렁이	3. Anterior end with collar of feather-shaped or branched tentacles forming a tentacle-crown4
TEREBELLIDAE		4. Operculum present; Calcareous tubes(as Table 1, fig. G; Fig. 2e, f, g, h, i)....SERPULIDAE
<i>Terebella ehrenbergi</i> Grube	고목나무유령갯지렁이	4. Operculum absent; Tube not calcareous.....5
<i>Loimia medusa</i> (Savigny)	짧은수술갯지렁이	5. Big tentacle-crown; Hooks in single rows (as Table 1, fig. F).....SABELLIDAE
SABELLIDAE		5. Three pairs of branchiae are present, on segments 2, 3 and 4 (as Table 1, fig. E).....TEREBELLIDAE
<i>Sabellastarte japonica</i> (Marenzeller)	꽃갯지렁이	
<i>Myxicola infundibulum</i> (Renier)	미끈꽃갯지렁이	
SERPULIDAE		
<i>Dexiospira alveolatus</i> Zachs	등근구멍판덮개꽃갯지렁이	POLYNOIDAE Malmgren, 1867
<i>Hydroides ezoensis</i> Okuda	우산판덮개꽃갯지렁이	Lateral antennae inserted terminally and continuous with the prostomial peaks; Elytra 18 pair (Table 1, fig. A; Fig. 1a, b)..... <i>Halosydna brevisetosa</i> Kinberg, 1855 (See Marenzeller 1902; Izuka 1912; Okuda 1938, 1940; Hartman 1939; Okuda and Yamada 1954; Imajima and Hartman 1964; Imajima and Gamo 1970; Banse and Hobson 1974; Rho and Song 1974, 1975; Paik 1975a; 1979a)

PRINCIPAL EXTERNAL DIAGNOSTIC CHARACTERS OF FAMILIES OF POLYCHAETOUS ANNELIDS INHABITING HANGING CULTCHES AT OYSTER FARMS IN CHINHAE BAY

Polychaetes usually are easily identified to the family level on the basis of their external characteristics. For this purpose, the following Table 1 provides an illustration and a summary of some external diagnostic characteristics for each family of the polychaetes.

KEYS

1. Dorsum covering horizontal scales (as Table 1,

HESIONIDAE Malmgren, 1867
Anterior end with 8 pairs tentacular cirri; Proboscis without jaws and terminal circlet; Anterior end without palpi (Table 1, fig. B; Fig. 1c).....*Hesione reticulata* Marenzeller, 1879
(See Marenzeller 1879; Fauvel 1936; Imajima and Hartman 1964; Paik 1975a)

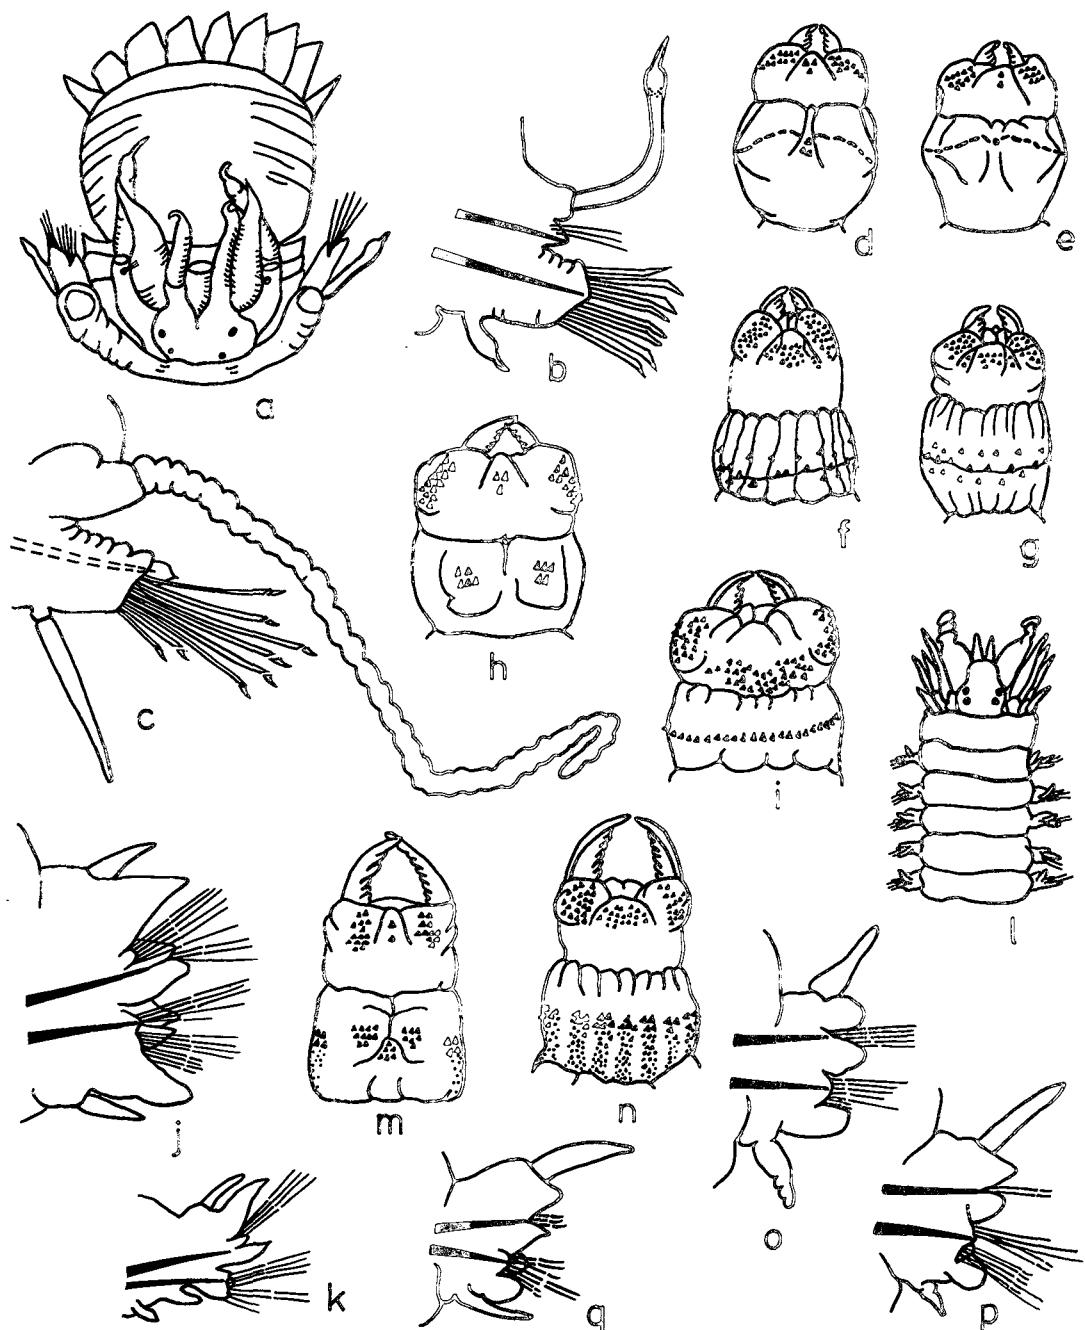

Fig. 1. *Halosydnia brevisetosa*: a, anterior end, dorsal view; b, median parapodium, anterior view. *Hesione reticulata*: c, median papopodium, anterior view. *Perinereis nuntia*: d, e, proboscis showing paragnaths, dorsal view; f, g, the same, ventral view. *Neanthes japonica*: h, proboscis showing paragnaths, dorsal view; i, the same, ventral view; j, fifth parapodium, anterior view; k, posterior parapodium, anterior view. *Nereis neoneanthes*: l, anterior end, dorsal view; m, proboscis showing paragnaths, dorsal view; n, the same, ventral view; o, fifth parapodium, anterior view; p, 30th parapodium, anterior view; q, posterior parapodium, anterior view.

NEREIDAE Johnston, 1865

1. Proboscis with paragnaths on both oral and maxillary rings; Paragnaths conical except those on area VI, which are transverse bars (Table 1, fig. C; Fig. 1d-g)
..... *Perinereis nuntia* (Savigny, 1818)
(See Savigny 1818; Marenzeller 1879; Fauvel 1919, 1930, 1932, 1936, 1953; Okuda 1938, 1939; Knox 1951, 1960; Okuda and Yamada 1954; Pillai 1961; Silva 1961; Chlebovitsch and Wu 1962; Imajima and Hartman 1964; Day 1967; Wu 1967; Imajima and Gamo 1970; Imajima 1972; Paik 1972 1975b, 1977, 1978; 1976a; Rho and Song 1974, 1975)
1. All paragnaths conical.....2
2. Notopodia with spinigers in anterior parapodia, partly or wholly replaced by falcigers in posterior parapodia; Areas VII and VIII are continuous with a dense, transverse band of many paragnaths on oral side.....3
2. Notopodia with spinigers throughout the body; Neuropodia with spinigers and falcigers; Areas VII and VIII are continuous and have one transverse row (Fig. 1h-k).....
..... *Neanthes japonica* (Izuka, 1908)
(See Izuka 1908, 1912; Okuda 1933, 1935; Okuda and Isikawa 1936; Okuda and Yamada 1954; Uschakov 1955; Wu and Chen 1963; Imajima and Hartman 1964; Uschakov and Wu 1965; Imajima 1972; Paik 1972, 1977, 1978; 1979a; Rho and Song 1974)
3. With paragnaths on area V of proboscis (Fig. 1l-p)..... *Nereis neoneanthes* Hartman, 1948
(See Hartman, 1948; Uschakov 1955; Buzhinskaja 1967; Imajima and Hayashi 1969; Banse and Hobson 1974; Paik 1975a, 1977)
3. Without paragnaths on area V of proboscis (Fig. 2 a-d)..... *Nereis multignatha* Imajima and Hartman, 1964
(See Izuka 1912; Imajima and Hartman 1964; Imajima 1967, 1968, 1970, 1972; Paik 1975a, 1977)

CHAETOPTERIDAE

Anterior end with one pair of palpi; Body has 3 regions; Anterior region with 9 segments, a median of 5, and a posterior of about 50 segments (Table 1, fig. D).....
..... *Chaetopterus variopedatus* (Renier, 1804)

(See Marenzeller 1879, Okuda 1935; Imajima and Hartman 1964)

TEREBELLIDAE

1. 20 thoracic setigerous segments; Peristomium with eyes; Tentacles not spotted; Thorax with 13 ventral gland shields; Three pairs of branchiae are present, on segments 2, 3 and 4; Each dendritically branched.....
..... *Terebella ehrenbergi* Grube, 1870
(See Okuda 1938; Imajima and Hartman 1964; Paik 1975a)
1. 17 thoracic setigerous segments; The third segment has a pair of well developed lateral lobes; Thorax with 15 gland shields (Table 1, fig. E)..... *Loimia medusa* (Savigny, 1818)
(See Savigny 1818; Fauvel 1936; Okuda 1938; Hartman 1961; Imajima and Hartman 1964; Paik 1978)

SABELLIDAE Malmgren, 1867

1. Thorax with long shafed uncini; Body enveloped a mucous sheath; Radioles number about 16 pair and are connected by a web for about one-sixth of their length; Thorax has 9 segments of which 8 has setae (Table 1, fig. F).....
..... *Myxicola infundibulum* (Renier, 1804)
(See Okuda 1939; Imajima and Hartman 1964; Fauchald 1970; Paik 1975)
1. Thorax with short shafed uncini; Thorax has 8 setigerous segments; Radioles have neither eyes nor dorsal stylodes; They are basally connected by a webbed membrane.....
..... *Sabellastarte japonica* (Marenzeller, 1884)
(See Okuda 1938; Takahashi 1941; Okuda and Yamada 1954; Imajima and Hartman 1964; Rho and Song 1974, 1975; Paik 1975a; 1979a)

SERPULIDAE Savigny, 1918

1. Body symmetrical; With 7 thoracic setigerous segments; Thoracic collar provided with capillary setae and bayonet-shaped setae with a pair of conical processes at base of blade; Operculum crown with spines on midline (Table 1, fig. G; Fig. 2h, i)
..... *Hydroides ezoensis* Okuda, 1934
(See Okuda 1939; Imajima and Hartman 1964; Paik

Polychaetous annelids growing in oyster farms

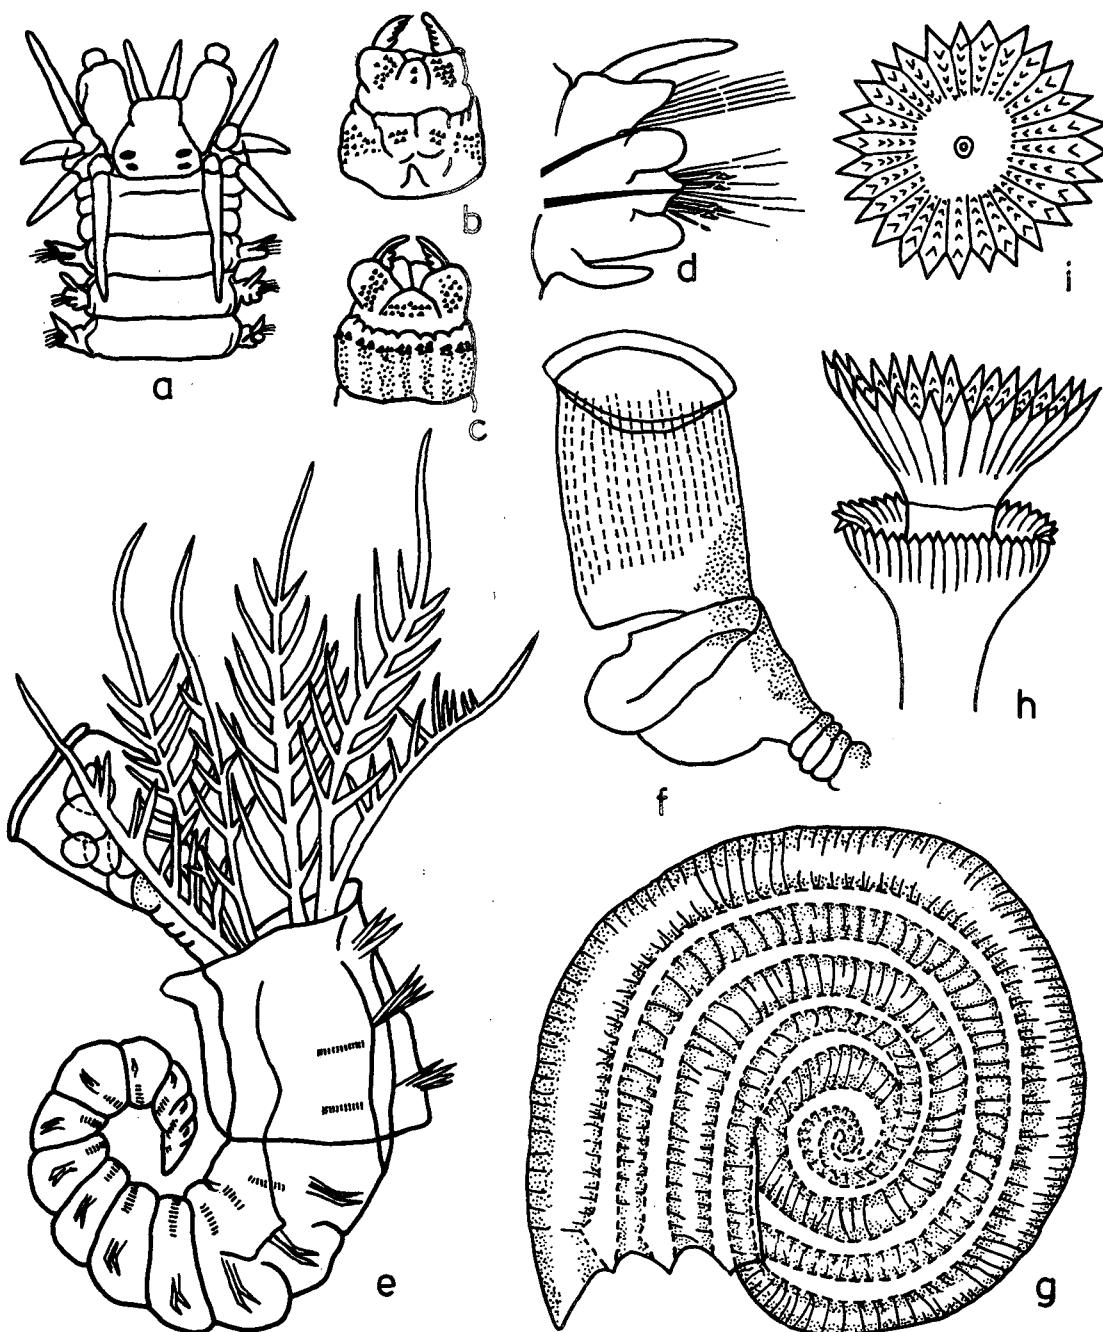

Fig. 2. *Nereis multignatha*: a, anterior end, dorsal view; b, proboscis showing paragnathes, dorsal view; c, the same, ventral view; d, fifth parapodium, anterior view. *Dexiospita alveolatus*: e, lateral view; f, operculum, lateral view; g, tube, upper view. *Hydroides ezoensis*: h, operculum, lateral view; i, the same, upper view.

1975, 1975a)

1. Body asymmetrical; With 3 thoracic setigerous segments; Crown has 3 pairs of radioles; Operculum is cylindrical and dotted on its outer surface; The distal part is brown and spherically concave; The basal calcareous plate is cupped; Thoracic uncini are present from the second setigerous segment. Tubes are attached to marine algae on oyster bed (Fig. 2e-g).....
.....*dexiospira alveolatus* Zachs, 1933
(See Okuda 1934; 1937; Imajima and Hartman 1964)
