0.260 .28 and 0.29 respectively, which is shown in Figure 6. The energy transferred into phonons increases as the incident collision energy is increased. In the low lenergy region, i.e., less than 400 meV , the rate of energy transfer sharply increases while in the high energy region, the rate is reduced.

# Formal Synthesis of Isocomene 

Hyo Won Lee*<br>*Department of Chemistry, Chungbuk National University, Cheongiu 360-763<br>Jae Hyun Lee and Ihl-Young Choi Lee

Korea Research Institute of Chemical Technology, Daejeon 302-343. Received March 6, 1991
A stereocontrolled synthesis of ( $\pm$ )-isocomene (1) via selective monoketalization of tricyclo[6.3.0.0 ${ }^{15}$ ]undeca-4,7-dione (13) was reported. Grignard reaction of bicyclic enone 10, which was prepared from 2 -methyl-1,3-cyclopentadione, gave the 1,4 -addition product 11. The subsequent aldol condensation product 12 was converted to mesyl derivative 13. Transformation from 13 to the desired product 19 was achieved by a series of reactions, i.e., the selective monoketalization at C-4 carbonyl group, the elimination of a mesyl group, Birch alkylation, methylation at $\mathrm{C}-6$, the reduction of carbonyl group, the dehydration of alcohol 18, and hydrolysis of the ketal group.

## Introduction

The tricyclic sesquiterpene isocomene (1) has the unique
framework of tricyclo[ $\left.6.3 .0 .0^{\text {L.5 }}\right]$ undeca-4,7-dione which comprises a variety of the polyquinanes. Since the first isolation of the tricyclic sesquiterpene isocomeme (1) in 1977 from

Figure 1.

Isocoma wrightii and Berkheya radula by Zalkow and Bohlmann, respectively. ${ }^{12}$ Isocomene (1) has been attracting the attention of synthetic chemists because of its unique structural feature of three contiguous, quaternary chiral centers. ${ }^{3}$

In previous communication, ${ }^{4}$ we have briefly described the synthesis of isocomene and herein, we report the details concerning to this synthesis. Our synthetic strategy of isocomene was based on the conjecture that bicyclo[3.3.0]octenone $\mathbf{2}$ can serve as an intermediate teading to tricyclic skeleton such as tricyclo[6.3.0.0.5] undecane 3. The structural similarity of bicyclo[3.3.0]octenone to the Wieland-Miescher ketone (4) known as a building block for the fused sixmembered rings ${ }^{5}$ indicates its usefulness as a building block, because the Michael addition to this enedione can provide an extra ring and thus lead to various products of polyquinanes such as coriolin and gymnomitrol. ${ }^{6.7}$ Recently optically active bicyclo[3.3.0]octenones have been prepared. In spite of this resourcefulness, however, up to date, only one example of the construction of tricyclo[ $\left.63.0 .0^{15}\right]$ undecane ring system from bicyclo[3.3.0]octenones has been reported. ${ }^{8}$ We herein described another application of bicyclo[3.3.0]octenone 2 to isocomene ( 1 ).

## Results and Discussion

In general, the synthesis of bicyclo[3.3.0]octenones have not been well pursued toward tricyclic system, since it was reported that triketone 5 did not give a product of bicyclo[3. 3.0] octenone under a variety of conditions of aldol condensations ${ }^{9}$ and this fact might have limited its usefulness as a synthetic intermediate. In order to circumvent this difficulty associated with triketone 5 , the preparation of the ketal of 5 from 2,2-dimethylpropan-1,3-diol was reported. ${ }^{10}$ But no further utilization has been explored at all. As for the synthesis of isocomene, we decided to exploit monoketal derivative of 8 from ethylene glycol instead of 2,2-dimethylpropan1,3 -diol, because it simplifies the synthesis.
In our synthetic plan, 2-methylcyclopetadione (6) was alkylated with propargyl bromide and $\mathrm{NaHCO}_{3}$ in water in $90 \%$ yield in order to prepare the bicyclic system. The resulting diketone 7 was easily transformed into the monoketal 8 in $82 \%$ yield by treating with ethylene glycol in the presence of a catalytic amount of p-toluenesulfonic acid (See Scheme 1).

The terminal acetylene group of 8 was converted to the acetyl group. The treatment of 8 with mercuric acetate in

Reagents:
(a) $\mathrm{NaHCO}_{3},{ }^{\circ} \mathrm{HC} \equiv \mathrm{CCH}_{2} \mathrm{Br}, 100^{\circ} \mathrm{C}, 5 \mathrm{~h}$ (b) $\mathrm{HOCH}_{2} \mathrm{CH}_{2} \mathrm{OH}, p-$ TsOH, Benzene, reflux, 3 h (c) $\mathrm{Hg}(\mathrm{OAc})_{2}$, pyridine, EtOH, 4 h , $\mathrm{H}_{2} \mathrm{~S}$ (d) $5 \%$ Methanolic KOH , reflux, 1 h .

## Scheme 1.

Reagents:
(a) $\mathrm{BrMg} \sim_{0}^{0}$ ) $\mathrm{CuBr} \cdot \mathrm{Me}_{2} \mathrm{~S}, \mathrm{THF}, 0^{\circ} \mathrm{C} \rightarrow \mathrm{RT}$ (b) $3 \% \mathrm{HCl}$, THF, reflux, 4 h (c) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCM}, 0^{\circ} \mathrm{C}$ (d) $\mathrm{TMSOCH}_{2} \mathrm{CH}_{2}$ OTMS, TMSOTf, DCM, $-20^{\circ} \mathrm{C}$, 24 h (e) DBU, DCM, RT (f) liq $\mathrm{NH}_{3}, \mathrm{Li}, \mathrm{THF}, t-\mathrm{BuOH}, \mathrm{CH}_{3} \mathrm{I},-78^{\circ} \mathrm{C} \rightarrow \mathrm{RT}(\mathrm{g})$ LDA, THF, $\mathrm{CH}_{3} \mathrm{I}$, $-78^{\circ} \mathrm{C} \rightarrow \mathrm{RT}$ (h) LAH, THF, $0^{\circ} \mathrm{C}, 3 \mathrm{~h}$ (i) $\mathrm{POCl}_{3}$, pyridine, 48 h ; $5 \% \mathrm{HCl}, \mathrm{THF}$.

Scheme 2.
pyridine at refluxing temperature lead to methyl ketone 9 in $76 \%$ yield. The aldol reaction of this ketone treating with $\mathbf{5 \%}$ ethanolic KOH provided the bicyclic enone 10 in $\mathbf{8 3 \%}$ yield.

In order to constitute tricyclic system upon this bicyclic enone, the intermolecular Michael addition was needed as the next step. Therefore, in the presence of the complex cuprous bromide-methyl sulfide, the Grignard reagent derived from 2 -(2-bromoethyl)-1,3-dioxolane at room temperature furnished $92 \%$ yield of 1,4 -conjugate addition product 11 from $10^{11}$ (See Scheme 2). In contrast, the Grignard reagent

Figure 2.
from 2-(2-bromoethyl)-1,3-dioxane was found to give poor yield and furthermore, it needed lower reaction temperature such as $-78^{\circ} \mathrm{C}$. The newly formed bond has exclusively a cis configuration relative to the angular methyl group, because the Grignard reagent could approach from sterically less crowded convex side of bicyclic enone system as shown in Figure $2^{30}$

The next step was the aldol condensation between the ketone and the aldehyde to introduce an extra ring. In the course of deprotection, we found that the selective deprotection between the ketal and the acetal of 11 was dependent on the acidic conditions. Under the treatment with oxalic acid in aqueous THF at room temperature, the acetal group was removed. But under the condition of $1 \% \mathrm{HCl}$ in THF at room temperature the ketal group was removed. In contrast, when the condition of refluxing in $3 \%$ aqueous HCl was employed, ketone 11 was converted to hyroxydiketone 12 in $73 \%$ yield via consecutive deprotection of the ketal and the acetal followed by the aldol condensation. The next step in the reaction sequence was the elimination of an aldolic hydroxyl group to obtain enone 15a. Therefore, the compound 12 was mesylated to obtain 13 by treating with methane sulfonyl chloride and triethylamine in dichloromethane and the subsequent elimination utilizing DBU gave smoothly enone $15 a$ in $95 \%$ yield.

Now it became necessary to introduce a methyl group at $\alpha$-position of $\boldsymbol{a}, \beta$-unsaturated ketone fragment by quenching of the Birch reduction intermediate of the enone with a methylating agent such as methyl iodide. Accordingly, we had to protect the carbonyl group at C-4 adjacent to the angular methyl in order to introduce the methyl group at C-8 postion. Without any protection of this carbonyl group, it would be difficult to obtain selective methylation at the position next to C-4 carbonyl group. When we tried chemoselective monoketalization of the endione 3 utilizing both conventional method and transketalization, ${ }^{12}$ we could not obtain the desirable result because of either poor selectivity or decomposition during reaction. After suffering from this difficult result, we found that the recourse for the success was the selective mono-ketalization prior to the elimination reaction of the mesylate derivative 13. Althoulgh, in the planar projection, it seems that the angular methyl group at C-5 gives more steric hindrance at C-4 carbonyl group, the examination of the three dimensional molecular models of diketone 12 by molecubar mechanics (MMII) calculation reveals that the carbonyl group at $\mathrm{C}-4$ position has almost same steric constrain as that of the carbonyl group at C-7 position. In addition, if a bulky methane sulfonate group was introduced at hydroxyl
group, this would bring in further steric congestion to the carbonyl group at C-7. From this supposition, the compound 12 was transformed into the mesylate derivative 13 in $93 \%$ yield by treating with methane sulfonylchloride and triethylamine in dichloromethane at $0^{\circ} \mathrm{C}$ and indeed, this derivative was successfully monoketalized at the C-4 carbonyl group in $85 \%$ yield by employing a mild treatment with 1,2 -bis(trimethylsilyloxy)ethane in the presence of TMSOTf at $-20^{\circ} \mathrm{C}$. ${ }^{13}$ Then, the mesyl group of 14 was eliminated by treating with DBU in dichloromethane to obtain the corresponding enone 15b in $89 \%$ yield. The following Birch reduction of enone 15b by lithium and $t$-BuOH in liquid ammonia and the quenching of the intermediate with methyl iodide gave $84 \%$ yield of 16. In order to attach a methyl group at C-6, 16 was reacted with LDA and methyl iodide to furnish $81 \%$ yield of the methylated ketone 17. The remaining transformations in the synthesis were the reduction of a ketone group to the hydroxyl group and subsequent elimination of this group. But the methylated ketone 17 was found to be resistive toward the reduction with sodium borohydride because of increased steric hindrance due to the attached methyl group. Nevertheless, this problem was overcome by utilizing a stronger reducing agent of lithium aluminum hydride to obtain the desired product 18 in $84 \%$ yield. Upon the subjection of standard dehydration condition by using phosphoroxyl chloride and pyridine for 48 hours, the compound 18 gave the elimination product in $82 \%$ yield, of which ketal was finally deprotected under acidic condition of $5 \% \mathrm{HCl}$ in THF to the desired product 19 in $95 \%$ yield. Finally, this work constitutes a formal total synthesis of isocomene, because ketone 19 was already transformed to racemic isocomene. ${ }^{33, \mathrm{~d}}$

## Experimental

General Comments. Melting points were determined on a Thomas-Hoover Uni-Melt apparatus in capillary tubes and are uncorrected. Infrared (IR) spectra were recorded on a Shimadzu IR-435 spectrophotometer. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were attained on Bruker AM- 300 NMR, Varian 360 EM, and Varian FX 80 spectrometers and measured in $\mathrm{CDCl}_{3}$ solution, unless otherwise stated, relative to $\mathrm{Me}_{4} \mathrm{Si}$, as an internal standard $(\delta=0.00)$. Mass spectra were obtained on a Schimadzu GCMS-QP 1000 at 70 eV and recorded herein (relative intensity and assignment). High resolution mass spectra (HRMS) were recorded on Joel JMS-DX303 mass spectrometer. Elemental analyses were taken on Perkin-Elmer 240 C elemental analyzer in our laboratories. Unless otherwise indicated in a specific experiment, all of the chemicals used were reagent grade and no additional purification has been done. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled over $\mathrm{P}_{2} \mathrm{O}_{5}$ or $\mathrm{CaH}_{2}$. t-Butyl alcohol was distilled over $\mathrm{CaH}_{2}$ and stored over molecular sieves. Tetrahydrofuran (THF) was distilled from sodium benzophenone ketyl immediately prior to use. Thin layer chromatography (TLC) was performed on Merck 60 F-254 glass plates without activation. Column chromatography procedures utilized silica gel (Merck, silica gel 60, 70-230 mesh).

2-Methyl-2-(2-propynyl)-1,3-cyclopentadione (7). To a solution of 2 -methyl 1,3 -cyclopentadione ( 6 ) ( $5.56 \mathrm{~g}, 50$ mmol) and $\mathrm{NaHCO}_{3}$ ( $4.2 \mathrm{~g}, 50 \mathrm{mmol}$ ) in $\mathrm{H}_{2} \mathrm{O}$ was added propargyl bromide ( $11 \mathrm{ml}, 60 \mathrm{mmol}$ ) at room temperature. The reaction mixture was warmed to $100^{\circ} \mathrm{C}$ for 4 h . After
cooling the reaction mixture was extracted with dichloromethane ( $2 \times 50 \mathrm{ml}$ ), dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure to give crude product, which was recrystallized in hexane-ethyl acetate (2:1) to yield a colorless solid 7 ( $6.75 \mathrm{~g}, 90 \%$ ) $\mathrm{mp} 71-72^{\circ} \mathrm{C}$ (lit. ${ }^{10}, 70-72^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 60 $\mathrm{MHz} ; \mathrm{CDCl}_{3}$ ) $\delta 1.03$ (brs, $\mathrm{CH}_{3}, 3 \mathrm{H}$ ), 2.00 (brs, $\mathrm{C}=\mathrm{CH}, 1 \mathrm{H}$ ), 2.50 (brs, $\mathrm{C} \equiv \mathrm{CCH}_{2}, 2 \mathrm{H}$ ), 2.85 (brs, $\mathrm{COCH}_{2}, 4 \mathrm{H}$ ); m/e 150 ( $\mathrm{M}^{+}, 15.3 \%$ ), 66 (47.4), 57 (20.2), 41 (100).

2-Methyl-2-(2-propynyl)-3,3-ethylenedioxy-1-cyclopentanone (8). To a solution of $7(7.5 \mathrm{~g}, 50 \mathrm{mmol})$ in benzene ( 150 ml ) were added ethylene glycol $(9.61 \mathrm{~g}, 100$ mmol) and a catalytic amount of $p-\mathrm{TsOH}(960 \mathrm{mg}, 5 \mathrm{mmol})$ with stirring at room temperature. The mixture was refluxed for 3 h . After cooling to room temperature, saturated aq. $\mathrm{NaHCO}_{3}$ was added to the reaction mixture. The benzene layer was separated and washed with water and brine. The organic extract was dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated in vacuo to give a crude product, which was purified by column chromatography (silica gel, hexane: ethyl acetate $=2: 1$ ) to provide the ketal $8(8.0 \mathrm{~g}, 82 \%), \mathrm{mp} 84 \sim 85^{\circ} \mathrm{C}$; IR ( KBr ) 2924, $1725 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(60 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) ~ \& 1.22$ (s, $\mathrm{CH}_{3}, 3 \mathrm{H}$ ), $1.90-2.50\left(\mathrm{~m}, \mathrm{CH}_{2}, 6 \mathrm{H}\right), 4.00\left(\mathrm{brs}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}\right.$, $4 \mathrm{H}) ; m / e 194\left(\mathrm{M}^{+}, 13.6 \%\right), 123$ (15.4), 99 (100), 86 (48.3), 56 (28.9), 45 (18.4), 41 (36.5); Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{3}$ : C, 68.02 ; H, 7.26. Found: C, 67.84; H, 7.27.

2-Methyl-2-(2-oxopropyl)-3,3-ethylendioxy-1-cyclopentanone (9). To a solution of ketal 8 ( $9.00 \mathrm{~g}, 46.0 \mathrm{mmol}$ ) in ethanol ( 200 ml ) were added $\mathrm{Hg}(\mathrm{OAc})_{2}(29.4 \mathrm{~g}, 92.0 \mathrm{mmol}$ ) and pyridine ( $7.30 \mathrm{~g}, 92.0 \mathrm{mmol}$ ). The solution was refluxed for 4 h . After cooling to room temperature, the reaction mixture was saturated with $\mathrm{H}_{2} \mathrm{~S}$ gas. Then the solution was filtered though Celite 545 to remove black precipitates of HgS . The solvent was evaporated to give a crude product, which was purified by column chromatography (silica gel, hexane: ethyl acetate $=1: 1$ ) to provide syrupy 9: ( $7.34 \mathrm{~g}, 75 \%$ ); IR ( KBr ) $2940,1732,1709 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(60 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) \delta$ $1.11\left(\mathrm{~s}, \mathrm{CH}_{3}, 3 \mathrm{H}\right), 1.80-2.60\left(\mathrm{~m}, \mathrm{CH}_{2}, 6 \mathrm{H}\right), 2.08\left(\mathrm{~s}, \mathrm{CH}_{3} \mathrm{CO}\right.$, 3 H ), 3.90 (brs, $\mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}, 4 \mathrm{H}$ ); m/e 212 (M+, $2.3 \%$ ), 169 (99.1), 113.0 (29.5), 69 (36.9), 55 (20.7), 43 (100).

5-Methyl-6.6-ethylenedioxy-bicyclo[3.3.0]oct-1-en-3-one (10). A solution of $9(7.50 \mathrm{~g}, 62.5 \mathrm{mmol})$ in $5 \%$ ethanolic KOH solution ( $20 \mathrm{~m} /$ ) was refluxed for 1 h . The reaction mixture was cooled to room temperature, neutralized with $10 \%$ aqueous HCl , extracted with dichloromethane $(2 \times$ 100 ml ), and dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated to give a crude product, which was purified by column chromatography (silica gel, hexane: ethyl acetate $=1: 1$ ) to afford a slightly yellow syrup 10 ( $5.35 \mathrm{~g}, 78 \%$ ); IR ( KBr ) 2940,1732 , 1702 , and $1138 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $60 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.29$ (s, $\left.\mathrm{CH}_{3}, 3 \mathrm{H}\right), 2.0-2.2\left(\mathrm{~m}, \mathrm{CH}_{2}, 2 \mathrm{H}\right), 2.3-2.8\left(\mathrm{~m}, \mathrm{CH}_{2}, 4 \mathrm{H}\right), 3.88$ (brs, $\mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{O}, 4 \mathrm{H}$ ), 5.70 (brs, $=\mathrm{CH}, 1 \mathrm{H}$ ); m/e $195(\mathrm{M}+1$, $15.9 \%$ ), $194\left(\mathrm{M}^{+}, 83.5\right), 86$ (100), 85 (36.4), 83 (55.3), 79 (43.9), 43 (59.8); HRMS $m / e$ Calcd for $\mathrm{C}_{11} \mathrm{H}_{24} \mathrm{O}_{3}: 194.0943$. Found: 194.0953.

1-[(3,3-Propylenedioxy)propyl]-6,6-(ethylenedioxy)-5-methylbycyclo-[3.3.0]octa-3-one (11). To a suspension of $\mathrm{Mg}(1.04 \mathrm{~g}, 42.8 \mathrm{mmol})$ in anhydrous THF ( 2 ml ) was added bromoethyl-1,3-dioxane ( $5.83 \mathrm{ml}, 42.8 \mathrm{mmol}$ ) via hyperdermic syringe under nitrogen. After stirring for 2 h , the solution was added to a mixture of the diene 10 (4.15 g, 21.4 mmol ) and $\mathrm{CuBr}-\mathrm{Me}_{2} \mathrm{~S}(1.10 \mathrm{~g}, 5.35 \mathrm{mmol})$ in $\mathrm{Me}_{2} \mathrm{~S}$
( 5 ml ) and THF ( 20 ml ) via syringe dropwise under nitrogen at $0^{\circ} \mathrm{C}$. The color of solution was changed to black and then the solution was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and ammonia water. The solution was extracted with dichloromethane ( $3 \times 50 \mathrm{~m}$ ) and dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated to give a crude product, which was purified by column chromatography (silica gel, hexane: ethyl acetate $=1: 2$ ) to furnish 11 as a solid ( $6.1 \mathrm{~g}, 92 \%$ ) , mp $72.73^{\circ} \mathrm{C}$; IR ( KBr ) $2930,1730,1138 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $80 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.05$ (s, $\mathrm{CH}_{3}, 3 \mathrm{H}$ ), $1.30-2.65\left(\mathrm{~m}, \mathrm{CH}_{2}, 14 \mathrm{H}\right), 3.87$ (brs, $\mathrm{OCH}_{2}$ $\left.\mathrm{CH}_{2} \mathrm{O}, 4 \mathrm{H}\right), 3.55-4.20\left(\mathrm{~m}, \mathrm{OCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{O}, 4 \mathrm{H}\right), 4.45(\mathrm{~m}, \mathrm{CH}$, $1 \mathrm{H}) ; m / e 310\left(\mathrm{M}^{+}, 0.9 \%\right), 113(28.4), 100(20.7), 99$ (100), 87 (10.7); Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{5}$ : C, 65.78; $\mathrm{H}, 8.44$. Found: C. 65.94; H. 8.52.

9-Hydroxy-5-methyltricyclo[6.3.0.0 ${ }^{1,5}$ ]undeca-4,7dione (12). To a solution of 11 ( $615 \mathrm{mg}, 1.99 \mathrm{mmol}$ ) in THF ( 10 ml ) was added $3 \% \mathrm{HCl}(10 \mathrm{~m}$ ) and the solution was refluxed for 4 h . Afther the cooling, the solution was neutralized with a saturated aqueous $\mathrm{NaHCO}_{3}$ and extracted with dichloromethane ( $2 \times 10 \mathrm{ml}$ ) and dried over anhydrous $\mathrm{MgSO}_{4}$. The solvent was evaporated under the reduced pressure to obtain the crude product which was purified by column chromatography (silica gel, hexane: ethyl acetate $=1: 1$ ) to provide 12 as a colorless solid: ( $280 \mathrm{mg}, 68 \%$ ), mp 48 49 C (hexane); IR ( KBr ) 3290 , $2950,1750 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.14\left(\mathrm{~s}, \mathrm{CH}_{3}, 3 \mathrm{H}\right.$ ), 1.62-2.77 (m, CH and $\mathrm{CH}_{2}$ 's, 11 H ), $4.54(\mathrm{~m}, \mathrm{CHOH}, 1 \mathrm{H}): m / e 208\left(\mathrm{M}^{+}, 6.8 \%\right), 190$ $\left(\mathrm{M}^{+}-\mathrm{H}_{2} \mathrm{O}, 11.3\right), 111$ (16.6), 109 (20.3), 83 (13.7), 80 (100), 79 (22.6), 43 (22.7), 41 (17.3); HRMS $m / e$ Calcd for $\mathrm{C}_{12} \mathrm{H}_{36} \mathrm{O}_{3}$ 208.1099. Found: 208.1097.

9- $\alpha$-methanesulfonyloxy-5-methyltricyclo[6.3.0.0 ${ }^{1.5}$ ] undeca-4,7-dione (13). To a solution of 12 ( $1.04 \mathrm{~g}, 5.0$ mmol ) and triethylamine ( $695 \mu, 5.0 \mathrm{mmol}$ ) in dichloromethane ( 10 m ) was added methanesulfonyl chloride ( $464 \mathrm{\mu}$, 6.0 mmol ) at $0^{\circ} \mathrm{C}$. After stirring for 3 h , water ( 2 ml ) was added to the solution and the organic layer was separated. The extract was dried over anhydrous $\mathrm{MgSO}_{4}$ and evaporated to dryness to obtain a crude product, which was triturated with hexane: ethyl acetate $=3: 1$ to furnish 13 as a white solid ( $1.19 \mathrm{~g}, 83 \%$ ); mp $140-141.5^{\circ} \mathrm{C}$ (decomp.); IR ( KBr ) 2960 , 1700, 1348, $1180,850 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{HNMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $1.17\left(\mathrm{~s}, \mathrm{CH}_{3}, 3 \mathrm{H}\right), 1.76-2.74\left(\mathrm{~m}, \mathrm{CH}_{2}\right.$ and $\left.\mathrm{CH}, 11 \mathrm{H}\right), 2.99(\mathrm{~s}$, $\left.\mathrm{OSO}_{2} \mathrm{CH}_{3}, 3 \mathrm{H}\right), 5.28(\mathrm{~m}, \mathrm{CH}, 1 \mathrm{H}) ; m / e 207\left(\mathrm{M}^{+}-79,0.8 \%\right)$, 163 (11.1), 107 (20.8), 93 (11.4), 91 (18.5), 80 (100), 79 (49.5), 55 (15.3), 43 (45.9) 41.0 (33.6); Anal. Calcd for $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{5} \mathrm{~S}$ : C, $54.53 ;$ H, 6.33 ; S, 11.19. Found: C, 54.47 ; H, 6.02 ; S, 11.14.
4,4-Ethylenedioxy-9-methanesulfonyloxy-5-methyltricyclo[6.3.0.0 ${ }^{1.5}$ ]-undeca-7-one (14). To a solution of 13 ( 286 mg .1 mmol ) and 1,2-bis(triethylsilyloxy)ethane ( 490 $\mu, 2 \mathrm{mmol}$ ) in dichloromethane ( 10 m ) was added a catalytic amount of trimethylsilyl trifluoromethanesulfonate at $-22^{\circ} \mathrm{C}$ under argon atmosphere. The resulting solution was stirred for 24 h with maintaining the temperature around $-20^{\circ} \mathrm{C}$. After the reaction was quenched with a few drops of pyridine, organic layer was separated by adding water ( 5 ml ). The organic layer was dried over anhydrous $\mathrm{MgSO}_{4}$ and the solvent was evaporated in vacuo to give a crude product. which was triturated with hexane: ethyl acetate $=3: 1$ to provide 14 as a white solid ( $260 \mathrm{mg}, 79 \%$ ), mp $106-108^{\circ} \mathrm{C}$; IR ( KBr ) $2950,1740,1350,1170$, and $890 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ( 60 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 1.15\left(\mathrm{~s}, \mathrm{CH}_{3}, 3 \mathrm{H}\right), 1.60-2.55\left(\mathrm{~m}, \mathrm{CH}_{2}, 11 \mathrm{H}\right)$,

# Effects of van der Waals Bonding on the Collisional Dissociation of a Highly Excited Chemical Bond 

Yoo Hang Kim and Hyung Kyu Shin ${ }^{\dagger}$<br>Department of Chemistry, Inha University, Inchon 402.751<br>${ }^{\dagger}$ Department of Chemistry, University of Nevada, Reno, Nevada 89557. USA. Received March 12, 1991

#### Abstract

Dissociation of a highly excited diatomic molecule in the $\mathrm{Ar}+\mathrm{Ar} \cdots \mathrm{O}_{2}$ and $\mathrm{Ar}+\mathrm{O}_{2}$ collisions is studied using trajectory dynamics procedures in the collision energy range of 0.050 to 1.0 eV . Between 0.050 and 0.2 eV , dissociation probabilities are very large for the complexed system compared to the uncomplexed system. This efficient dissociation of $\mathrm{O}_{2}$ in $\mathrm{Ar} \cdots \mathrm{O}_{2}$ is attributed to the ready flow of energy from the incident atom to the large-amplitude vibrational motion of the excited $\mathrm{O}_{2}$ via the van der Waals bond. Thermal-averaged dissociation probabilites of $\mathrm{O}_{2}$ in $\mathrm{Ar}+\mathrm{Ar} \cdots \mathrm{O}_{2}$ near room temperature are nearly two orders of magnitude larger than those of $\mathrm{O}_{2}$ in $\mathrm{Ar}+\mathrm{O}_{2}$.

## Introduction

In recent studies on the collision dynamics of van der Waals (vdW) complexes, we have shown that excitation of vdW complexes is very efficient and that the energy initially present in a high-frequency chemical bond remains when the collision is over. ${ }^{1,2}$ When a heavy mass barrier is present between vdW bonds, energy flow from one vdW bond to another becomes seriously hindered and energy localizes in one of the weak bonds. ${ }^{34}$ Energy flow blockage in molecular systems by heavy atoms or multiple bonds has been investigated by many researchers in recent years. ${ }^{4-15}$ In a vdW complex involving diatomic and rare gas atom units, the chemical bond essentially conserves its individuality and experiences weak dynamical coupling with the vdW bond because of the large disparity in oscillator frequencies. Energy transfer to the chemical bond is, therefore, inefficient and the energy initially present in the bond remains when the collision is over. However, a new situation arises when the chemical bond is highly excited, especially to near the dissociation thereshold. At such excitation, the chemical bond becomes seriously weakened and undergoes a low-frequency vibrational motion, which may even be comparable to that of the vdW bond. In the complex with such a highly excited
bond, a weak coupling between the vdW and chemical bonds can become sufficient to induce efficient intramolecular energy flow, thus causing the molecular unit to gain enough energy for dissociation.
The purpose of this paper is to study the effects of vdW bonding on the dissociation of $\mathrm{O}_{2}$ in $\mathrm{Ar} \cdots \mathrm{O}_{2}$, in which the chemical bond is in a highly excited state. Such a complexed state is particularly important in the studies of thermal dissociation of $\mathrm{O}_{2}$ dispersed in the argon gas or in the argon matrix. ${ }^{16}$ In this model system, another Ar atom is incident on the complex to perturb its internal state. This collisioninduced intramolecular dynamics will be treated in classical mechanics by sampling a sufficiently large number of trajectories in the collision energy range of 0.050 to 1.0 eV . The result will then be compared with that of $\mathrm{Ar}+\mathrm{O}_{2}$ to discuss the effects of vdW bonding on the dissociation of $\mathrm{O}_{2}$ in the complex. In both the complexed and uncomplexed systems, $\mathrm{O}_{2}$ is initially either in the ground state $\rho \mathrm{r}$ in a highly excited state with the vibrational energy equal to $99 \%$ of the dissociation energy.

## Interaction Model

For the incident Ar approaching the linear complex $\mathrm{Ar} \cdots \mathrm{O}_{2}$
