nals of 8 at 6.21 ppm , near 6.02 ppm and 3.78 ppm were disappeared. The formation of an aromatic system could be the driving force in this reaction.
The extension of the photoaddition reactions of $o$-quinones to conjugated systems, and the chemistry of these photoproducts, will be investigated.

## Epoxidation of $\beta, \gamma$-Unsaturated Carboxylic Acids by Dimethyldioxirane

## Hea-Young Park Choo

School of Pharmacy, Ewha Womans University,<br>Seoul 120-750

Received August 12, 1993

Peroxy acids, one of the most commonly used electrophilic epoxidizing agents, are not effective in the epoxidation of olefins containing carboxyl groups because of electron withdrawing property of the carboxyl group ${ }^{3}$. Moreover the acid generated from the peroxyacid is difficult to separate from the desired product, epoxy acid. Nucleophilic epoxidizing agents, hydrogen peroxide together with various catalysts (base, tungsten, etc.), are effective only to $\alpha, \beta$-unsaturated acids ${ }^{2}$. Recently dimethyldioxirane ${ }^{3}$ has been employed for epoxidation of $\alpha, \beta$-unsaturated ketones ${ }^{4}$, acids ${ }^{5}$ and esters. Not only electron rich alkenes such as enol ethers ${ }^{6}$ and lactones ${ }^{7}$ but also electron poor alkenes such as vinyltetrazoles ${ }^{8}$, flavons ${ }^{9}$ are also epoxidized by dimethyldioxirane in high yield. But not many unsaturated carboxylic acids have been epoxidized by dimethyldioxirane. Here we report this powerful agent, which can be generated in situ from potassium peroxomonosulfate (oxone) and acetone ${ }^{i 0}$, is effective in the epoxidation of $\beta, \gamma$-unsaturated acids.

Most $\beta, \gamma$-unsaturated acids tested in this study were rapidly reacted with dimethyldioxirane to give the corresponding epoxy acids in good yield (Table 1). The product yield decreased when there were two carboxyl groups or an amide group in the molecule. We confirmed that the epoxidation of $\alpha, \beta$-unsaturated carboxylic acids are smoothly carried out by dimethyldioxirane, as reported previously ${ }^{4}$. But under the same reaction condition, a $\gamma, \delta$-unsaturated carboxylic acid was transformed to the lactone instead of the epoxide. This is probably due to the spontaneous opening of epoxide.

The procedure ${ }^{8}$ for epoxidation of $\beta, \gamma$-unsaturated acids was very simple and convenient: Ansaturated acid (0.001

Table 1. Epoxidation of unsaturated carboxylic acids by dimethyldioxirane

| Unsaturated acids | Epoxy acids | Time (h) | \% yield |
| :---: | :---: | :---: | :---: |
| $\sim \mathrm{COOH}$ | $\mathrm{O}_{1} \mathrm{COOH}$ | 0.5 | 74 |
| $\sim \mathrm{COOH}$ | $\xrightarrow[\sim]{\mathrm{O}} \mathrm{COOH}$ | 0.5 | 96 |
| $\sim^{\mathrm{COOH}}$ | ${ }^{\mathrm{O}} \mathrm{Y}_{3}^{\mathrm{COOH}}$ | 0.5 | 82 |
| $\mathrm{HOOC} \sim \mathrm{COOH}$ | $\mathrm{HOOC} \xrightarrow{-0}{ }_{4}^{0}$ | 0.5 | 59 |
| $\sim_{\mathrm{NH}}^{0} \mathrm{COOH}^{0}$ | $\xrightarrow{0} \mathrm{NH}^{0} \mathrm{C}_{5}^{0}$ | 2.5 | 71 |
| $\sim \mathrm{COOH}$ | $\stackrel{0}{4} \mathrm{COOH} 6$ | 0.5 | 55 |
| $x^{\mathrm{COOH}}$ | ${ }_{\mathrm{CO}_{\mathrm{CH}_{2} \mathrm{OH}}^{0}}$ | 0.5 | 51 |

mol) was dissolved in 5 ml of acetone and 3 ml of water. With vigorous stirring, sodium bicarbonate ( 0.014 mol ) and oxone ( 0.004 mol ) were added to this solution. The stirring was continued for two hours at room temperature. The reaction mixture was acidified to $\mathrm{pH} 1-2$ with conc. hydrochloric acid, then 50 ml of ethyl acetate was added. After filtration, two layers were separated and the water layer was extracted with ethyl acetate. The combined organic layer was dried and the solvent was removed in vacuo, yielding the epoxides. The products were reasonably pure judging from their NMR spectra ${ }^{11}$. Only epoxy acid 5 required chromatographic separation.
