1,3-Dipolar cycloaddition reactions of nitrile oxides with olefins are very interesting reactions in organic synthesis due to their facile induction of stereocenters<sup>1</sup> and easy conversion<sup>2</sup> of the resulting isoxazolines to synthetically useful functional groups, such as  $\beta$ -hydroxyketones,<sup>1c,3</sup>  $\beta$ -hydroxyamines,<sup>4</sup>  $\alpha,\beta$ -unsaturated ketones,<sup>5</sup> substituted tetrahydrofurans.<sup>6</sup> Although the 1,3-dipolar cycloaddition reactions of nitrile oxides with  $\alpha,\beta$ -unsaturated ketones generally afforded a mixture of two regioisomers, the cycloadditions of aryl nitrile oxides with 2-cyclopenten-1-one could afford predominantly the corresponding 3-aryltetrahydrocyclopent[d]isoxazol-4-ones (**1**).<sup>7</sup>

The reductions of 3-alkyl-3a,5,6,6a-tetrahydro-4H-cyclopenta[d]isoxazol-4-ones by NaBH<sub>4</sub> were reported<sup>8</sup> to afford only 3a,4-*cis* isomers in quantitative yields. We have also found that the reduction of 3-methyl-3a,5,6,6a-tetrahydro-4H-cyclopenta[d]isoxazol-4-one showed a similar diastereoselectivity and gave a 9:1 mixture of 3a,4-*cis* and 3a,4-*trans* isomer. However, there have been few studies on the reduction and Grignard reaction of carbonyl group in **1**.<sup>1f,8</sup> Herein we wish to report the diastereoselective reduction and Grignard reaction of carbonyl group in **1**.<sup>1f,8</sup>

When the carbonyl group of 3-aryltetrahydrocyclopent[d]isoxazol-4-ones (**1**) were reduced to the corresponding 3-aryltetrahydrocyclopent-1,2-isoxazol-4-ols (**2**) by sodium borohydride in methanol, we isolated only 3a,4-*cis*-3a,6a-*cis*-isomers in excellent yields without any trace of 3a,4-*trans*-3a,6a-*cis*-isomers. This excellent diastereoselectivity may result from the attack of reducing agent to the convex side of the *cis*-fused structure. Interestingly, the reduction of

3a,7a-*cis*-3-phenyl-3a,4,5,6,7,7a-hexahydro-1,2-benzisoxol-7-one, a 6-membered ring-fused isoxazolinone by NaBH<sub>4</sub> showed less diastereoselectivity and afforded a 2:1 mixture of 3a,4-*cis* and 3a,4-*trans* isomers.<sup>9</sup>

The relative stereochemistry of three stereocenters of **2a** (Ar = phenyl) were confirmed by NOE experiments in <sup>1</sup>H NMR. Irradiation of H-3a at 4.07 ppm showed 2.36% and 2.12% enhancement of signals for H-4 at 4.55 ppm and H-6a at 5.21 ppm, respectively.

Grignard reactions of methylmagnesium chloride or ethylmagnesium bromide with **1** were examined in THF at 0 °C, and we observed the reactions proceeded very slow and afforded **3** in low yields with the complicated by-products probably due to the abstraction of acidic protons at C-3a or C-5 position. When Imamoto's method<sup>10</sup> was applied in this Grignard reaction, we found that the reaction was completed within 3 h at -78 °C in excellent yield. All of the products obtained from the Grignard reactions of **1** were only 3a,4-*cis*-3a,6a-*cis*-isomers as expected, which were confirmed by

NOE experiments in <sup>1</sup>H NMR. In case of **3a** (Ar=phenyl), irradiation of H-3a at 3.77 ppm showed 4.81% and 4.63% of enhancement of signals for CH<sub>3</sub>-4 at 1.48 ppm and H-6a at 5.22 ppm, respectively. The results are summarized in Scheme 1 and Table 1.

The catalytic hydrogenation<sup>3</sup> with Raney Ni of 3a,4-*cis*-3a,6a-*cis*-3-phenyl-3a,5,6,6a-tetrahydro-4H-cyclopenta[d]isoxazol-4-ol (**2a**) provided the corresponding 2-benzoyl-1,3-cyclopentanediol **4** in good yields as shown in Scheme 2. For the structure of **4** has a symmetric plane, proton peaks of H-1 and H-3 appeared at same position (4.72-4.69 ppm) in <sup>1</sup>H NMR spectrum and only eight carbon peaks were found in <sup>13</sup>C NMR spectrum. The irradiation of H-2 at 3.41 ppm showed 8.25% enhancement of signals for H-1 and H-2 at 4.71 ppm in <sup>1</sup>H NMR of **4** (Ar=Ph). We could confirm the relative stereochemistry of three stereocenters of **4** by these NMR experiments.

In conclusion, we could prepare the highly functionalized cyclopentanes *via* diastereoselective reductions or Grignard reactions of 3-aryl-3a,5,6,6a-tetrahydro-4H-cyclopenta[d]isoxazol-4-ones prepared from the 1,3-dipolar cycloadditions of nitrile oxides with 2-cyclopenten-1-one, followed by the reductive cleavage of the isoxazoline ring.

### Experimental Section

<sup>1</sup>H NMR spectra, <sup>13</sup>C NMR spectra, and spectra of NOE experiments were recorded on Bruker AM-300MHz using TMS as a internal standard. FTIR spectra were taken with Digilab FTs-80 or Digilab FTs-165 spectrometer. HRMS spectra were obtained by Jeol JMX-DX 303 mass spectrometer. Flash column chromatography was carried out on silica gel Merck (230-400 mesh). All chemicals and solvents except THF were directly used from commercial sources. THF was dried over potassium metal before use.

**General procedure for the reduction of 1 with NaBH<sub>4</sub>.** To a solution of 3-aryl-3a,5,6,6a-tetrahydro-4H-cyclopenta[d]isoxazol-4-one (3 mmol) in 95% methanol (20 mL) was added NaBH<sub>4</sub> (6 mmol, 2 equiv) at 0 °C in small portions. After stirred for 30 min, the reaction mixture was poured into cold water and extracted with ethyl acetate. The organic layer was washed with brine, dried over MgSO<sub>4</sub>, and concentrated by a rotary evaporator to afford pure 3a,4-*cis*-3a,6a-*cis*-3-aryl-3a,5,6,6a-tetrahydro-4H-cyclopenta[d]isoxazol-4-ol (**2**). The yields and spectroscopic data are as follows.
