Received Juhy 24, 2002
An efficient procedure for the synthesis of 6,7 -dichloro- 5,8 -phthalazinedione ( 4 ) was developed in $49 \%$ overall yield via chloroxidation of 5,8 -diaminophthalazine (8). And a series of its derivatives, 7-pyridinium-5,8-phthalazinedione-6-oxide (9). 6-chloro-7-phenylamino-5,8-phthalazinedione (10), 6,6-dimethosy-6/1-2,3,6b,11-tetraazabenzolaffluoren-5-one (11a). and 6,6-diethosy-6H-2,3,6b, l1-tetraazabenzolaffuoren-5-one (11b) have been synthesized.

Key Words: Phthalazine, Ftlicient synthetic route, Chloroxidation, 6, 7-Dichloro-5,8-phthalazinedione

## Introduction

The quinone compounds show various biological activities ${ }^{1}$ and some of the heterocyclic quinones are especially known to have an anticancer activity. ${ }^{2}$ In a previous paper, ${ }^{3}$ we described the synthesis and cytotoxicity of 2-methy l-4.9dily dro-1-substituted-1//-imidazo $4.5-g]$ quinoxaline- 4.9 -diones (1) and 2.3 -disubstituted-5.10-pyrazino $2.3-g] q u i n o x a-$ linediones (2), respectively. which showed excellent biological activity against human gastric adenocarcinoma cells

(MKN +5). The compounds $\mathbf{1}$ and 2 were obtained from 6.7-dichloro-5.8-quinoxalinedione (3) by an improved synthetic method. ${ }^{3}$

During the course of our program directed towards the development of novel DNA intercalators based on nitrogencontaining heterocyclic quinones. we envisaged that 6.7-dichloro-5.8-phthalazinedione could be an useful intermediate for the preparation of phthalazinedione derivatives which would be a novel DNA intercalator. Although the method has been described for the preparation of compound 4 in the literature. ${ }^{4}$ its overall yield was very low (total yield: $10 \%$ ). We describe here an efficient procedure for the syntheses of 6.7 -dichloro- 5.8 -phthalazinedione ( 4 ) and its derivatives $9,10,11 \mathrm{a}$ and 11 b from 4 .

## Results and Discussion

The synthesis of 6.7-dichloro-5.8-phthalazinedione (4) is depicted in Scheme 1. Nitrophthalazine (6) was obtained by treatment of phthalazine (5) with $\mathrm{KNO}_{3}$ in $\mathrm{H}_{2} \mathrm{SO}_{1}{ }^{-1}$ Introduction of the amino group was realized by exposure to $\mathrm{HONH}_{2}$ in a mixture of EtOH and MeOH in the presence of KOH at

Scheme 2
$50-55^{\circ} \mathrm{C}$ to give 4 -nitro-7-aminophthalazine (7) in $66 \%$ yield. ${ }^{5}$ In the presence of $\mathrm{FeCl}_{3}$ catalyst. reduction of 7 with hydrazine hỵdrate gave diaminophthalazine 8 in quantitative yield. Subsequently chloroxidation with $\mathrm{NaClO}_{3}$ in concentrated hydrochloric acid led to 6.7 -dichloro-5.8-phthalazinedione ( 4 ) in $94 \%$ yield. ${ }^{\text {irs }}$ Under these conditions, the key intermediate + could be prepared in improved yield compared to the previous process (total yield: $49 \%$ ).
Having the key intermediate 4 in hand, we carried out the reactions of 4 with the appropriate mucleophiles in alcoholic solvents or $\mathrm{CH}_{3} \mathrm{CN}$ (Scheme 2). The 6.7-dichloro-5.8phthalazinedione + was treated with pyridine in EtOH at 60

Figure 1. The ORTEP drawing of the molecular structure of 11 b .
${ }^{\circ} \mathrm{C}$ to furnish zwitterionic compound 9 in $83 \%$ yield. ${ }^{\prime}$ Treatment of + with aniline in $\mathrm{CH}_{3} \mathrm{CN}$ in the presence of $\mathrm{CeCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ gave compound $10 .{ }^{6}$ Interestingly, when 4 was treated with 2-aminopy ridine in alcoholic solvents ( MeOH , EtOH ) at $60^{\circ} \mathrm{C}$, we obtained the tetracyclic compounds 11 a and 11b. ${ }^{\text {T- }^{-}}$The structure of tetracy clic compound 11b was unambiguously determined by X-ray crystallographic analysis (Figure 1).

The mechanism might be postulated as follows: the chlorine atom in the initial cyclized product $\mathbf{A}$ is replaced by an alkosy group to give the intermediate $\mathbf{B}$. And then attack of one more alkoxy group is followed to provide the products 11 a and 11 b .
ln conclusion, we developed an efficient procedure for the synthesis of 6.7-dichloro-5.8-phthalazinedione (4). and prepared four of its derivatives $9,10.11 \mathrm{a}$ and 11 b by the treatment of 4 with pyridine. aniline and 2-anumopyridine in alcoholic solvents or $\mathrm{CH}_{3} \mathrm{CN}$. respectively. The illustrated method for the preparation of 4 and its reaction with nucleophiles may serve as a important tool for the synthesis of phthalazine derivatives.

## Experimental Section

Melting points were determined on Thomas-Hoover capillary apparatus and were uncorrected. IR spectra were measured with a Perkin-Elmer 1710 spectrophotometer. ${ }^{~} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker Avance 300 . Mass spectra were obtained on Jeol SX-102. Elemental analyses were performed with FISONS instruments EA 1108 elemental analyzer. The X-Ray diffraction was measured on an Enraf Nonius $\mathrm{CAD}+$ diffractometer.

5-Nitrophthadazine (6). Potassium nitrate (73.2 g. 0.72 mol) was added in small portions to a solution of phthalazine $(20.0 \mathrm{~g}, 0.15 \mathrm{~mol})$ in conc. $\mathrm{H}_{2} \mathrm{SO}_{4}(150 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. After the addition was completed the mixture was heated at 55-60 ${ }^{\circ} \mathrm{C}$ for 2 days. and then diluted with water at $0^{\circ} \mathrm{C}$. The misture was neutralized with sodium hydroxide solution. The precipitate was filtered. and washed with water. The filtrate was extracted with EtOAc, and the extract was washed with brine. dried over $\mathrm{MgSO}_{4}$ and concentrated to dryness. The residue was washed with cold MeOH and combined with the precipitate obtained above. The small amount of water in the product was removed by evaporation with toluene to afford $6(21.3 \mathrm{~g} .79 \%)$ as a pale yellow solid: mp 186-189 ${ }^{\circ} \mathrm{C}$ (from EtOH) (lit. ${ }^{+}, 188-189^{\circ} \mathrm{C}$ ).
5-Nitro-8-amino-phthalazine (7). A solution of $\mathrm{HONH}_{2}$. $\mathrm{HCl}(62.0 \mathrm{~g} .0 .89 \mathrm{~mol})$ in MeOH ( 1 L ) was added to a solution of $6(26.0 \mathrm{~g} .0 .15 \mathrm{~mol})$ in $\mathrm{EtOH}(1.5 \mathrm{~L})$ slowly with stirring over a period of 3 h at $50-55^{\circ} \mathrm{C}$. The reaction misture was quenched by addition of ice water. The precipitate was filtered, and washed with water. The solvents of filtrate were evaporated off and the residue was taken up in EtOAc and water, which was extracted with EtOAc. The extract was washed with brine, dried over $\mathrm{MgSO}_{1}$ and concentrated to dryness. The residue was combined with the precipitate obtained above. and which was washed with cold MeOH to give $7(18.7 \mathrm{~g}, 66 \%)$ as a pale yellow solid: mp $>300{ }^{\circ} \mathrm{C}$ (from EtOH). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz} . \mathrm{DMSO}-t_{6}$ ): $\delta$ $10.29(\mathrm{~s} . \mathrm{lH}) .9 .76(\mathrm{~s}, 1 \mathrm{H}) .8 .50(\mathrm{~d} . J=9.2 \mathrm{~Hz}, 1 \mathrm{H}) .8 .23(\mathrm{~s}$. $2 \mathrm{H}) .6 .97(\mathrm{~d} . j=9.2 \mathrm{~Hz} . \mathrm{lH}) .{ }^{1.3} \mathrm{C}$ NMR ( 75 MHz DMSOd6): $\delta 154.0,146.8$. 146.4. 134.7. 129.4. 122.0. 113.5. 112.4. 5,8-Diaminophthalazine (8). To a solution of 7 ( $1+.2 \mathrm{~g}$. 74.7 mmol ) in $\mathrm{MeOH}\left(700 \mathrm{ml}\right.$ ) was added $\mathrm{FeCl}_{3}(70.0 \mathrm{mg}$. 0.43 mmol ) and charcoal ( 4.50 g ), and the mixture was refluxed for 5 h . The product was filtered through celite. Evaporation of the solvent gave $8(11.9 \mathrm{~g}, 99 \%)$ as a pale yellow solid: mp $249-250^{\circ} \mathrm{C}$ (from EtOH ). ${ }^{1} \mathrm{H}$ NMR ( 300
 ${ }^{1 .} \mathrm{C}$ NMR ( 75 MHz . DMSO- $\%$ ): $\delta$ 147.5. 135.8. 118.3 . 115.3. IR (KBr): $3312,3170.1556,1+72,1372 \mathrm{~cm}^{-1}$. 6,7-Dichlorophthalazine-5,8-dione (4). To a solution of 8 $(7.09 \mathrm{~g} .+4.3 \mathrm{mmol})$ in conc. $\mathrm{HCl}(90.0 \mathrm{~mL})$ was added $\mathrm{NaClO}_{3}$ ( $6.08 \mathrm{~g} .+9.6 \mathrm{mmol}$ ) in many portions at $0^{\circ} \mathrm{C}$. The reaction mixture was stirred for 1 h at rt . quenched by addition of water and the precipitate was filtered. The filtrate was neutralized with saturated $\mathrm{NaHCO}_{3}$ solution. and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with water and brine. dried over $\mathrm{MgSO}_{4}$ and concentrated to dry ness. The residue was combined with the precipitate obtained above to give $4(9.56 \mathrm{~g} .94 \%)$ as a pale yellow solid: mp 223$225^{\circ} \mathrm{C}$ (from EtOH) (lit. $.^{+} .223-225^{\circ} \mathrm{C}$ ). ${ }^{1} \mathrm{H}$ NMR $(300 \mathrm{MHz}$. $\mathrm{CDCl}_{3}$ ) : $\delta 9.93$ (s. 2H). ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz} . \mathrm{DMSO}-l_{6}$ ): $\delta$
