# Eschenmoser-Claisen Rearrangement of Baylis-Hillman Adducts ${ }^{\dagger}$ 

Jeong Mi Kim. Sung Hwan Kim, and Jae Nyoung Kim*<br>Deparment of Chemistry and Institute of Basic Science, Chonnam National University, Gwangit 500-757, Korea<br>*E-mail: kimin@chonnam.ac.kr Received May 16, 2007

Key Words : Eschenmoser-Claisen rearrangement, Baylis-Hillman adducts, DMA-DMA

Johnson-Claisen rearrangement of the Baylis-Hillman adducts has been reported by Basavaiah and co-workers to produce alkyl alk-4-enoate derivatives stereoselectively. ${ }^{\text {la }}$ Das and co-workers examined the Johnson-Claisen rearrangement of Baylis-Hillman adducts with triethyl orthoacetate and reported the applicability of $\mathrm{I}_{2} / \mathrm{SiO}_{2}$ or $\mathrm{NaHSO}_{4} / \mathrm{SiO}_{2}$ systems. ${ }^{1 \text { t.c }}$ We also examined the reaction of $a z a$-BaylisHillman adducts ${ }^{2 a}$ and Baylis-Hillman adducts ${ }^{2 b}$ with N.Ndimethylformamide dimethylacetal (DMF-DMA), and we obtained cinnamyl amine derivatives in both cases. ${ }^{2}$

However, literature survey revealed that EschenmoserClaisen rearrangement ${ }^{3}$ of Baylis-Hillman adducts has not been reported. ${ }^{2 b}$ Thus, we decided to examine the Eschen-moser-Claisen rearrangement of Baylis-Hillman adducts ( $\mathbf{1 a - c}, \mathbf{1 g}$, and $\mathbf{1 h}$ ) and cinnamyl alcohol derivatives ( $\mathbf{1 d - f}$ ) with $N, N$-dimethylacetamide dimethylacetal (DMA-DMA) and report herein the results (Scheme 1 shows the synthesis of $\mathbf{2 a}$ and 2 d as representative examples)
Required starting materials 1a-h were synthesized accord-
ing to the reported methods. ${ }^{1.24}$ The reaction conditions including the amounts of DMA-DMA, solvent, and temperature were examined and we found that optimum yields were obtained with 2.0 equiv of DMA-DMA in toluene at around $80-90^{\circ} \mathrm{C}$. The results are summarized in Table 1 and the reaction mechanism is depicted in scheme 1. For the secondary alcohol derivatives 1 a-c, some ester compounds (3a: $5 \%$ in entry 1 and 3b: $4 \%$ in entry 2 ) were formed together (due to the competitive formation of intermediate III) and the yields of desired products $2 \mathrm{a}-\mathrm{c}$ were moderate $(69-71 \%)$. The products 2 a and 2 b were isolated as $E / Z$ mixtures (ca. $9: 1$ ) as in the Johnson-Claisen rearrangement of the Baylis-Hillman adducts. ${ }^{\text {I }}$ The product $\mathbf{2 c}$ was obtained as a pure $Z$ isomer, however, 2 -dimethylaminomethyl-3phenylacrylonitrile ( $4, Z$-form ${ }^{2 b}$ was isolated together ( $13 \%$ ). The primary alcohol derivatives $\mathbf{1 d - 1}$ were cleanly converted into 2d-f in moderate to good yields ( $75-84 \%$ ) and we could not find the conresponding ester derivatives in these cases. The Baylis-Hillman adducts of 2-cyclohexen-1-

[^0]Table 1. Eschenmoser-Claisen rearrangement of Baylis-Hillman adducts

"Isolated yields. ${ }^{b}$ The reaction was carried out in toluene with DMA-
 based on II NMR. Ar is 4-nitrophenyl.
one, 1 g and $\mathbf{1 h}$, were also converted into 2 g and $\mathbf{2 h}$, respectively, in moderate yields.
In summary, we disclosed the Eschenmoser-Claisen rearrangement of Baylis-Hillman adducts ${ }^{5}$ and cimnamyl alcohol derivatives with N.N-dimethylacetamide-dimethylacetal (DMA-DMA) in toluene to produce 2-benzylidene 1,5-dicarbonyl compounds and 2-methylene 1,5-dicarbonyl derivatives in moderate yields.

## Experimental Section

Typical procedure for the synthesis of $2 a$ and the
spectroscopic data of $\mathbf{2 a - h}, \mathbf{3 a}, \mathbf{3 b}$, and 4 are as follows. A mixture of 1a ( $192 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) and DMA-DMA ( 266 $\mathrm{mg}, 2.0 \mathrm{mmol}$ ) in toluene ( 3 mL ) was stirred at $80-90^{\circ} \mathrm{C}$ for 2 h . After removal of solvent desired product was separated by column chromatographic purification process (hexanes/ EtOAc, $3: 5$ ) as pale yellow oil, $183 \mathrm{mg}(70 \%)$.

Compound 2a: $70 \%(E / Z=9: 1)$; pale yellow oil; IR (film) $2950,1708,1654,1648,1250 \mathrm{~cm}^{-1}$; Н NMR ( $\mathrm{CDCl}_{3}, 300$ $\mathrm{MHz}) \delta 2.53-2.58(\mathrm{~m}, 2 \mathrm{H}), 2.86-2.90(\mathrm{~m}, 2 \mathrm{H}), 2.94(\mathrm{~s}, 3 \mathrm{H})$, $3.00(\mathrm{~s}, 3 \mathrm{H}), 3.83(\mathrm{~s}, 3 \mathrm{H}), 7.25-7.40(\mathrm{~m}, 5 \mathrm{H}), 7.73(\mathrm{~s}, 1 \mathrm{H})$; ${ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right) \delta 23.52,32.77,35.34,37.16$, $52.05,128.65,128.66,129.29,131.61,135.20,140.24$, 168.62, 171.97.

Compound $2 \mathbf{b}:^{2 \mathrm{~b}} 69 \%$ ( $E / Z=9: 1$ ); pale yellow oil; IR (film) $2935,1704,1650 \mathrm{~cm}^{-1}$; H NMR ( $\mathrm{CDCl}_{3}, 300 \mathrm{MHz}$ ) $\delta 1.35(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 2.53-2.60(\mathrm{~m}, 2 \mathrm{H}), 2.73-2.76(\mathrm{~m}$, $2 \mathrm{H}), 2.94(\mathrm{~s}, 3 \mathrm{H}), 3.00(\mathrm{~s}, 3 \mathrm{H}), 4.28(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H})$, $7.30-7.42(\mathrm{~m}, 5 \mathrm{H}), 7.73(\mathrm{~s}, 1 \mathrm{H}) ;{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right)$ $\delta 14.29,23.51,32.78,35.29,37.14,60.84,128.55,128.61$, $129.25,130.87,135.25,139.92,168.09,172.00$.
