# Synthesis of Facial Amphiphile 3,7-Diamino-5 $\alpha$-cholestane Derivatives as a Molecular Receptor 

Md. Wasi Ahmad, Young Mee Jung, Sharaf Nawaz Khan, and Hong-Seok Kim*<br>Deparment of Apphed Chemistry, Kvungpook Vational University, Daegu 702-701. Korea. E-mail: kimhsohnu. ac.kr Received Jufy 21, 2009, Accepted August t. 2009

#### Abstract

A series of facial amphiphiles 3,7-diaminocholestane were synthesized from 3,7-diketocholestane via 2 sequential reductive aminations and anion recognition was evaluated with acetate, chloride, bromide, fluoride and phosphate anions. The stereo-selective reductive amination protocol was utilized to synthesized facial amphiphiles afforded receptors in high yields. The molecular receptor 2 showed the highest binding constant with acetate in a $1: 1$ ratio.

Key Words: Facial amphiphile. Anion receptor. Reductive amination. Aminosteroids. Stereoselectivity

## Introduction

Design of preorganized molecular receptor provides the advantage of rigid scaffolds that could be functionalized further with ligands for anion recognition. Steroid molecules are notorious for their preorganized stnictures provide a platform to constitute a molecular receptor and offer ease of functionalization. The ligands for the H -bonding e.g. amine group in the steroid scaffold of cholic acid were introduced through ether, ester or amide linkages. ${ }^{1}$ The hydroxyl group could be transformed to ether linkages or ester linkages conveniently but were found to be unstable in higher pH values. ${ }^{2}$ Hence introduction of the amine group directly to steroids were cynosure in steroid based molecular receptor syntheses. ${ }^{3}$

Cholic acid scaffolds having a cis AB ring or $5 \beta$ configuration supports functionalization at $\mathrm{C} 3 . \mathrm{C} 7$ and C 12 while chole-sterol-based receptors having an AB trans ring or $5 \alpha$ configuration supports modification at C3 and C7. The advantage of cholesterol-based receptors is that they offer exactly the same bond length attachment of ligands at C3 and C7 in an axial manner, while in the same position with $5 \beta$-configuration it is not possible. The introduction of an axial amino group at C 3 and C 7 could be derivatized rapidly in a quantitative yield. The preferred method by Davis et al. to introduce the $\mathrm{NH}_{2}$ group was through inversion at stereogenic centers and azide formation or by oximation and metal-assisted reduction in a multi-step synthesis afforded overall low yield. ${ }^{4}$ The amino group becomes highly hỵdrophilic. which gives an edge in intramolecular hydrogen bonding and solubility in non-polar

Figure 1. Perspective drawing of cholesterol-based molecular receptor.
solvents. Figure I showed cholesterol based facial amphiphilic anionic receptors. which was derivatized with urea at C3 and C7 in an axial fashion. A highly stereoselective synthesis of 3 $\alpha .7 \alpha$-diaminocholestane (1) from $3 \beta$-acetoxy- $5 \alpha$-cholest-7one (3) by reductive amination methodology has been investigated. and was further elaborated on to synthesize anionic receptors. ${ }^{5}$
To get the facial amphiphile 2 . one-step direct reductive amination of diketone 4 with $\mathrm{NH}_{4} \mathrm{OAc}$ in the presence of $\mathrm{NaBH}_{3} \mathrm{CN}$ was carried out which resulted in the formation of $6 \mathrm{a}(34 \%)$ along with a mixture of $3 \alpha / 3 \beta$-isomers of 3.7 -dihydroxycholestane. To improve the yield and stereo-selectivity of 6 a . the sequential procedure was investigated.

## Experimental Section

Melting points were determined using a Thomas-Hoover capillary melting point apparatus and are uncorrected. The NMR spectra were recorded on a Bruker AM- 400 spectrometer in $\mathrm{CDCl}_{3}$ using $\mathrm{Me}_{4} \mathrm{Si}$ as the internal standard. Elemental analyses were performed on a Calro Erba 1106 at the Center for Scientific Instruments, Kyungpook National University, HR-FAB Mass spectra were taken at KBSI Daegu branch. TLC analyses were carried out on a plate precoated with 0.2 mm of HPTLC silica gel 60 : substances were visualized by spraying with $5 \%$ ammonium molybdate in $10 \% \mathrm{H}_{2} \mathrm{SO}_{4}$ followed by heating. Flash column chromatography was performed with Merck silica gel 60 (70-230 mesh). Reactions were carried out under an argon atmosphere, and the solutions were washed with brine and dried over anhydrous sodium sulfate. Compound 4 was obtained by literature method. ${ }^{5}$

30 -(tert-Butyloxycabonyl)amino-5 (t-cholestane (5a). NaBH $(\mathrm{OEh}){ }_{3}{ }^{8}(+\mathrm{mL} .2 \mathrm{eq})$ was added to a solution of $+(200 \mathrm{mg}$. $0.50 \mathrm{mmol})$ and $\mathrm{NH}_{4} \mathrm{OTf}(250 \mathrm{mg}, 1.50 \mathrm{mmol})$ in a dry THF $(10 \mathrm{~mL})$ and stirred at room temperature for 1 h . After the solvent was removed, the residue was extracted with ethyl acetate. The organic layer was washed. dried. and concentrated. Without further purification, the residue was treated with ( Boc$)_{2} \mathrm{O}(164 \mathrm{mg} .0 .75 \mathrm{mmol})$ in methanol ( 20 mL ) for 3 h . After the solvent was removed. the residue was extracted with ethyl acetate. The organic layer was washed. dried, and con-
centrated. The residue was purified by a column chromatograply (elution with $5 \%$ EtOAc-hexane) to give 190 mg of 5 a ( $76 \%$ ) and 23 mg of $3 \beta$-isomer ( $9 \%$ ). 5a: TLC $\mathrm{R}_{\mathrm{f}} 0.52$ (EtOAchexane 1:4): mp $169-172^{\circ} \mathrm{C}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-h e x a n e\right)$ : ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right)$ $\delta 0.59\left(\mathrm{~s} .3 \mathrm{H} .18-\mathrm{CH}_{3}\right), 0.80\left(\mathrm{~d} . ## Results and Discussion

The requisite starting material 4 was prepared from commercially available $3 \beta$-acetoxy-cholest- 5 -ene. ${ }^{5}$ The reductive amination of 4 , with $\mathrm{NaBH}(\mathrm{OAc})_{3}$ and $\mathrm{NH}_{4} \mathrm{OTf}$. followed by protection with (Boc) 2 O gave 5 a as a mixture of a $3 \alpha / 3 \beta$-isomer in a $69 \%$ yield. High diastereo-selectivity has been achieved by modifying $\mathrm{NaBH}_{4}$ with different carboxylic acids. in the synthesis of squalamine analogues. ${ }^{6}$ Thus, in order to improve selectivity toward the $3 \alpha$ isomer. various acy loxyborohydrides were prepared from $\mathrm{NaBH}_{4}$ and the bulky carboxylic acids." $\mathrm{NaBH}(\mathrm{OEh})_{3}$ prepared from 2 -ethylhexanoic acid (Eh) improved the stereo-selectivity of 5 a and reaction time was shortened to 1 h : it provided $3 \alpha / 3 \beta$ with a ratio of $9: 1 \mathrm{in}$ an $85 \%$ yield. The stereochemistry of 5 a was determined based on the $\mathrm{R}_{\mathrm{f}}$ value and the chemical shift of the $3 \alpha-\mathrm{NH}$ proton in the ${ }^{1} \mathrm{H}$, and those of $\mathrm{C}-3$ and $\mathrm{C}-7$ in the ${ }^{13} \mathrm{C}$ NMR spectrum. The ${ }^{1} \mathrm{H}$ NMR of 5 a showed a $3 \alpha-\mathrm{NH}$ proton of an $\alpha$ isomer at $\delta 4.88$. In the ${ }^{13} \mathrm{C}$ NMR spectrum of 5 a C-3 carbamate and $\mathrm{C}-7$ carbonyl carbons appeared at $\delta 155.3$ and 212.1 and tert-butyloxy carbon at $\delta 79.2$. Further relative stereochemistry
was confirmed by data obtained from COSY. HETCO. DEPT, and comparisons were made with the similar published structure. ${ }^{8}$

The reductive amination of $\mathbf{5 a}$ at $\mathrm{C}-7$ was accomplished by $\mathrm{NaBH}_{3} \mathrm{CN}$ and $\mathrm{NH}_{4} \mathrm{OAc}$ in a co-solvent of THF and methanol in high yield. The ${ }^{1} \mathrm{H}$ NMR of 6 a showed the $7 \alpha-\mathrm{NH}$ and $7 \beta-\mathrm{H}$ protons of the $7 \alpha$ isomer at $\delta 4.73$ and 3.67 . respectively. In the ${ }^{13}$ C NMR. C-7 and C-3 of the $\alpha$ isomer appeared at $\delta 46.1$ and 43.0 , respectively. These values are in accordance with published values. ${ }^{3}$ It is interesting to note that a bulky reducing reagent such as $\mathrm{NaBH}(\mathrm{OEh})_{3}$ did not give any amino product. Hence it was concluded from the pattern of reducing reagent that bulkier reagents gave $3 \alpha$ product and smaller reagents furnish $7 \alpha$ products preferentially.

Compound 4 was further derivatized with $n-\mathrm{BuNH}_{2} . \mathrm{BocNH}$ $\left(\mathrm{CH}_{2}\right)_{3} \mathrm{NH}_{2} . \mathrm{BocNH}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{NH}_{2}$ and $\mathrm{BocNH}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{~N}(\mathrm{Boc})\left(\mathrm{CH}_{2}\right)_{4}$ $\mathrm{N}(\mathrm{Boc})\left(\mathrm{CH}_{2}\right)_{3} \mathrm{NH}_{2}$ (Boc-spermidine) having various alkyl chain lengths in consistently high yield and stereoselectivity. 1-(3-Aminopropyl)imidazole and 2-(2-pyridyl)ethylamine were also used to prepare receptors. They reacted with + smoothly to give $\mathbf{5}$ and $\mathbf{5 g}$ in $92 \%$ and $93 \%$ yields, respectively. The latter could be converted to facial amphiphiles $6 f$ and 6 g in a high yield by reductive amination at C 7 with $\mathrm{NaBH}_{3} \mathrm{CN}$. When 2-picolylamine reacted with 4 which gave 5 h in a $78 \%$. and it undergo reductive amination at C 7 with $\mathrm{NaBH}_{3} \mathrm{CN}$ to yield 6 h in an $84 \%$ yield (entry 8 . Table 1). The reductive amination of 4 with secondary amine, di-(2-picolyl)amine. proceeded smoothly at C 3 but failed to aminate at C 7 . It was evident from Table I that steric hindrance played an important role while synthesizing $3 \alpha$-amines 5 by reductive amination from 4.

Boc deprotection of $\mathbf{6 a}$ with TFA gave diamine $\mathbf{1}$. and subsequent reaction with phenyl isocyanate in a dry chloroform provided receptor 2 in good yield. The anionbinding properties of 2 were initially investigated by ${ }^{1} \mathrm{H}$ NMR titrations in $\mathrm{CDCl}_{3}$ with tetrabutylammonium salts of $\mathrm{F}^{-} . \mathrm{Cl}^{-} . \mathrm{CH}_{3} \mathrm{CO}_{2}^{-}$, and $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$. The highest association constant ( $K_{a}^{*}=42.000 \mathrm{M}^{1}$ ) was obtained for $\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}$anion as shown in Table 2. The complexation of Y-shaped $\mathrm{CH}_{3} \mathrm{CO}_{2}^{-}$anion with 5 easily formed H -bonding with urea protons. ${ }^{3_{3}}$ The molecular calculations of complex between 2 and acetate ion showed acetate ion bind with two $3 \alpha$-urea $\mathrm{N}-\mathrm{H}$ and two $7 \alpha-u r e a \mathrm{~N}-\mathrm{H}$ protons through hydrogen bonds

In conclusion. $3 \alpha .7 \alpha$-aminocholestane-based anionic receptors have been synthesized by reductive amination protocol with modified sodium acyloxyborohydride reagent in ligh yield and stereoselectivity. This procedure will be used to prepare various molecular receptors with compounds $6 \mathbf{a}-6 \mathrm{~g}$. The anion-binding studies of the remainder of the receptors are currently under investigation.
