‡School of Nano & Advanced Materials and Enginnering, Gyeongsang National University, Jinju 660-701, Korea Received September 18, 2008, Accepted February 2, 2009

The new candidates for OTFTs, which were composed of naphthalene, anthracene, benzo [1,2-b:4,5-b'] dithiophene and 2-decylbithiophene end-capper were synthesized under Suzuki coupling reaction conditions. All of the oligomers were characterized by FT-IR, mass analysis, UV-vis, PL spectrum, cyclic voltametry (CV), differential scanning calorimetry (DSC), thermal gravimetric analysis (TGA), <sup>1</sup>H-NMR and <sup>13</sup>C-NMR. Investigation of physical properties showed that all of the oligomers have higher oxidation potential and good thermal stability. Especially, DBT-DtB-DBT is soluble in common solvents and suitable for low cost processing technologies.

**Key Words**: Suzuki coupling. Photoluminescence, Cyclic voltametry, Thermal gravimetric analysis, Differential scanning calorimetry

### Introduction

During the past decades, organic semiconducting materials have been interest of electronic industry due to their high potential applications as a low-cost alternative to silicon. A many kinds of conjugated oligomers and polymers were synthesized and investigated for their electrochemical property as new organic semiconductor candidates.<sup>1-5</sup> Among the most potential materials for organic semiconductor, thiophene and anthracene based oligomers have received special attentions due to their good electrochemical properties and thermal properties.<sup>6-9</sup> Recently, hybrid thiophene-phenylene oligomers were reported as good organic materials for OTFTs (organic thin film transistors). 10-12 Ponomarenko and co-worker also reported the synthesis and characterization of the bithiophenephenylene-bithiophene conjugated cores, which have good oxidation and thermal stability as well as good characterizations for OTFTs. 13.14 As an example, the mobility of 1,4-bis(5-decyl-2.2-bithien-5-yl)benzene (Dec-2T-Ph-2T-Dec) is up to 0.3 cm<sup>2</sup>/V.s. This result was explained due to the effect of the long decyl end group, which is leading improved molecular order. More recently, it was also reported that semiconducting materials based on naphthalene and anthracene core units exhibited excellent field effect performances with mobility as high as  $0.14 \text{ cm}^2/\text{V.s}$  and on/off ratio up to  $6.3 \times 10^{6.15}$ 

In this paper, we report the synthesis of a new candidates for OTFTs, which were composed of core units such as naphthalene, anthracene and benzo[1.2-b:4,5-b']dithiophene and 2-decylbithiophene as an end-capper. And also we report the electrochemical properties of synthesized molecules.

### **Results and Discussion**

**Synthesis.** The synthetic strategy to the desired molecules is illustrated in Scheme 1, 2 and 3. Compound 4 was prepared from bithiophene 1 as starting material (Scheme 1). A starting material bithiophene 1 was prepared according to literature<sup>16</sup> and easily converted into 2-decylbithiophene 2, which was brominated with NBS in DMF to give 3 in 94% yield. Compound 3 was treated with 2-isopropoxy-4.4,5,5-tetramethyl-1,3.2-dioxaborolane in the presence of *n*-BuLi to give 4 in 73% yield.

The preparation of 2.6-dibromobenzo[1,2-b:4,5-b']dithiophene 11<sup>15</sup> and 2.9-dibromoanthracene 14<sup>18</sup> were synthesized according to literature procedures, respectively (Scheme 2). The 2,6-dibromonaphthalene 15 was purchased from Alfa Aesar Co.

Scheme 1

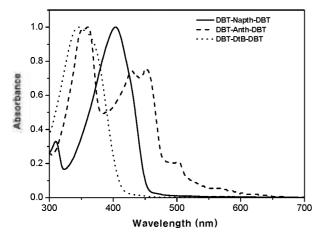

Scheme 3

The obtained 4 was used for coupling reaction with 11. 14 and 15 in next step. The target material DBT-DtB-DBT (16). DBT-Anth-DBT (17) and DBT-Napth-DBT (18) were synthesized under the conditions of Suzuki coupling reaction in the presence of Aliquat \$336 as a phase transfer catalyst in toluene to give 65%. 72% and 79% yield, respectively. The coupling reaction between 4 and 14 or 15 were carried out in toluene as an usual solvent of Suzuki reaction conditions to give 17 and 18 easily. However, the coupling reaction between 4 and 11 were carried out in THF instead of toluene (Scheme 3).

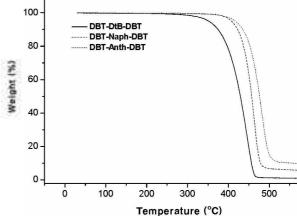

Compound 16 was soluble in common solvents and the structure was confirmed by <sup>1</sup>H-NMR, <sup>13</sup>C-NMR, IR and mass analysis. However, compound 17 and 18 were soluble in hot toluene, chlorobenzene and dichlorobenzene only. Therefore, their structures were confirmed by mass and IR spectroscopy because of their poor solubility.

Optical and electrochemical properties. The optical properties of synthesized oligomers were investigated using

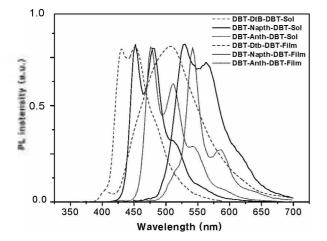

UV-vis absorption and photoluminescence (PL) in dilute CHCl<sub>3</sub> solution and on thin film. The results are shown in Figure 1 and 2 and summarized in Table 1. UV absorption maxima in dilute CHCl<sub>3</sub> solution were exhibited at 346 nm for 16, at 310 and 404 nm for 18 and at 361, 430, 452 nm for 17, respectively. The experimental results of UV absorption of 16, 17 and 18 were almost coincident with the increasing of conjugation length in their structures. In PL spectra, all of the oligomers exhibited blue fluorescence in solution. The emission spectra of oligomers in solid state displayed a large red shift about 60-80 nm. These results can be originated from the formation of aggregation or excimer in thin film due to  $\pi$ - $\pi$ \* stacking or intermolecular interaction caused by their planar structures. The electrochemical behaviors of oligomers were investigated by cyclic voltametry (CV). The cyclic voltammograms (CVs) of oligomers were recorded in a  $1.0 \times 10^{-3}$  M CHCl<sub>3</sub> solution containing 0.1 M Bu<sub>4</sub>NClO<sub>4</sub>. The oxidation peak potentials of oligomers were summarized in Table 1. In

Table 1. Summary of the physical data of DBT-DtB-DBT, DBT-Anth-DBT and DBT-Napth-DBT.

Compound	λ <sub>aba≀nm</sub> -	$\lambda_{em,nm}^{b}$		- E /aV	T <sub>5d</sub> /°C°	E <sub>o</sub> /eV	HOMO/eV <sup>d</sup>	LUMO/eV°
		Solution	Film	E <sub>ox</sub> /eV	158/ C	Eg/€ V	HOMO/ev	Lowchev
DBT-DtB-DBT	346	431, 452	509	1.0	351	3.00	-5.4	-2.40
DBT-Anth-DBT	361, 430, 452	476, 512	542, 587	0.89	412	2.55	-5.3	-2.75
DBT-Napth-DBT	310, 404	479, 452	530, 563	1.1	406	2.74	-5.4	-2.66

<sup>a</sup>Measured in dilute CHCl<sub>3</sub> solution <sup>b</sup>Excited at the absorption maxima <sup>c</sup>Obtained from DSC and TGA measurements under N<sub>2</sub> at a heating rate of 10 <sup>a</sup>C/min <sup>d</sup>Calculated using the empirical equation: HOMO =  $-(4.44 - E_{creet})$  <sup>c</sup>Calculated from LUMO = HOMO +  $E_g$ 

addition, the optical band gaps ( $E_{\rm g}$ ) of oligomers were determined from the absorption onset. The optical band gaps of **16**. **17** and **18** were found to be 3.00, 2.55 and 2.74, respectively. Table I summarizes the HOMO/LUMO energies of DBT-DtB-DBT, DBT-Anth-DBT and DBT-Napth-DBT estimated from the relation  $E_{\rm (LUMO)} = E_{\rm (HOMO)} + E_{\rm gap}$ , where  $E_{\rm (HOMO)}$  is classically estimated from  $E_{\rm onset}$  [x]. HOMO energy level of the oligomers were shown in the range of -5.3 eV to -5.4 eV, which are lower than that of  $\alpha$ -sexithiophene ( $\alpha$  6T, HOMO level of -5.0 eV). These results indicated that the synthesized oligomers have low band gap. For p-type semi

conductors, the majority carriers are holes. For this reason, it is important to reduce the energy barrier between gold electrode and organic semiconductor so that the HOMO levels of p-type semiconductors should be closed to the work function of gold electrode (-5.4 eV).<sup>21</sup> Therefore, it can be assumed that the injection of charge carriers may be hindered. In addition, the determined HOMO levels of p-type semiconductors match well to the work function of gold metal used in OTFTs, which leads increasing of efficiency of the injection and transport of holes.

Thermal properties. The thermal properties of obtained

oligomers were investigated by thermal gravimetric analysis (TGA) and differential scanning calorimetry (DSC) in a nitrogen atmosphere. TGA curve reveals that the oligomers have high thermal stability. Five percent weight loss ( $T_{5d}$ ) was observed at 351 °C, 412 °C and 406 °C for 16, 17 and 18, respectively. The results are shown in Figure 3 and summarized in Table 1.

These decomposition temperatures are higher than that of  $\alpha$  $6T (T_{5d} = 322 \, ^{\circ}C)$  under similar conditions. The decomposition of 16 is lower than those of 17 and 18, this result can be explained due to less thermal stability of benzo[1,2-b:4,5-b']dithiophene. The thermal characterization of 16, 17 and 18 were investigated by DSC thermogram. Compound 16 exhibits an endothermic peak at 185 °C and an exothermic transition at 180 °C. The results are summarized in Table 1. DSC thermogram of 17 reveals an endothermic peak at 259 °C and an exothermic peak at 257 °C. Compound 17 also displayed good thermal feature under heating and cooling cycle. DSC thermogram of 18 reveals an endothermic peak at 316 °C and an exothermic peak was observed at 309 °C. All revealed thermal features of 16, 17 and 18 showed that all of the three oligomers are crystalline and it is expected that their thin films are well ordered under heat treatment.

## Conclusions

We reported the synthesis of new 2-decylbithiophene end-capped oligomers, which were synthesized from Suzuki coupling reaction of naphthalene, anthracene and benzo[1,2-b:4,5-b']-dithiophene with compound 4 and their properties were investigated. Investigation of thermal properties revealed that all of the oligomers have good thermal stability from 350 °C to 410 °C as compared to a6T ( $T_{5d}$  = 322 °C). The optical and electrochemical properties showed that the synthesized oligomers have higher oxidation potential due to their high HOMO energy levels (-5.4 eV for 16, -5.4 eV for 18 and -5.3 eV for 17). In particularly, compound 16 exhibited good solubility in common solvents and can be used in low cost fabrication technologies. The fabrication of OTFTs using performance will be reported in the future.

# Experimental

Materials. 2-Bromothiophene, 3-bromothiophene, 2.6-diaminoanthraquinone, decanoyl chloride. *N*-bromosuccinimide (NBS), 2-isopropoxy-4.4.5.5-tetramethyl-1.3.2-dioxaborolane, *N*-formylpiperidine, *N*,*N*-dimethylformamide (DMF), copper (II) bromide, tetrakis(triphenylphosphine)palladium. Aliquat <sup>8</sup> 336 were purchased from Aldrich Chemical Co. The 2.6-dibromonaphthalene (15) was purchased from Alfa Aesar Co. All reagents purchased commercially were used without further purification except for diethylether, tetrahydrofuran (THF) dried with sodium/benzophenone.

Synthesis of 2,2'-bithiophene (1),<sup>16</sup> 2,6-dibromobenzo[1,2-b:4,5-b']dithiophene (11)<sup>17</sup> and 2,9-dibromoanthracene (14)<sup>18</sup> were carried out according to literature procedures.

**2-Decyl-5-(thiophen-2-yl)thiophene (2).** To a solution of 2.2'-bithiophene 1 (3.17 g. 19.1 mmol) in anhydrous benzene

(20 mL) was added decanoyl chloride (4.07 mL, 20.0 mmol) at r.t. TiCl<sub>4</sub> (2.25 mL, 20.5 mmol) was added to the reaction mixture at 0 °C and stirred for 15 min at 0 °C. Ice water was added to the reaction mixture and the resulting mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (50 mL), washed successively with water (200 mL) and saturated aqueous solution of NaHCO<sub>3</sub> (100 mL), dried over MgSO<sub>4</sub> and evaporated under reduced pressure to afford 5.00 g (85%) of yellow solid expected as the desired ketone intermediate. The intermediate was used for next step without purification.

To the solution of intermediate in toluene (40 mL) was added a suspension of LiAlH<sub>4</sub> (4.6 g. 121 mmol) and AlCl<sub>3</sub> (4.03 g. 30.3 mmol) in anhydrous Et<sub>2</sub>O (100 mL) at 0 °C under nitrogen atmosphere. The reaction mixture was stirred for 1h at r.t. The reaction mixture was cooled to 0 °C, EtOAc (20 mL) and 6M HCl (50 mL) were added. The resulting mixture was extracted with Et<sub>2</sub>O (2 × 300 mL), washed with water (100 mL), dried over MgSO4 and evaporated under reduced pressure. The residue was purified by flash column chromatography on silica gel (petroleum ether) to give compound 2 (6.00 g, 93%) as a colorless oil. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  7.16 (dd, J =5.4Hz, 1.3Hz, 1H), 7.09 (dd, J = 3.5Hz, 1.3Hz, 1H), 6.99 (dd, J = 5.4Hz. 3.5Hz, 1H). 6.98 (d, J = 3.5Hz, 1H). 6.67 (d. J =3.5Hz, 1H), 2.78 (t, J = 7.6Hz, 7.5Hz, 2H), 1.67 (m, 2H), 1.34 (m. 14H), 0.90 (t. J = 7.0Hz, 3H); <sup>13</sup>C NMR (75 MHz, CDCl<sub>3</sub>) δ 145.4, 138.0, 134.8, 127.7, 124.7, 123.7, 123.4, 123.0, 32.0, 31.7, 30.2, 29.7, 29.6, 29.5, 29.4, 29.2, 22.8, 14.2; MS m/z  $306 \, (M^{\dagger}).$ 

5-Bromo-5'-decyl-2,2'-bithiophene (3). In the absence of light. NBS (1.22 g, 6.86 mmol) was added in one portion to a solution of compound 2 (2.00 g. 6.53 mmol) in DMF (30 mL) and the reaction mixture was stirred for 0.5 h. After diluting with petroleum ether (50 mL), the reaction mixture was washed with saturated aqueous solution of NH<sub>4</sub>Cl (100 mL). dried over MgSO<sub>4</sub> and evaporated under reduced pressure. The residue was purified by column chromatography on silica gel (petroleum ether) to give compound 3 (2.36 g. 94%) as a white solid. mp 35-38 °C;  ${}^{1}$ H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  6.93 (d. J = 3.5Hz, 1H), 6.91 (d. J = 3.5Hz, 1H), 6.82 (d. J = 3.7Hz,1H), 6.66 (d, J = 3.7Hz, 1H), 2.78 (t, J = 7.6Hz, 2H), 1.67 (m, 2H), 1.34 (m, 14H), 0.90 (t, J = 6.9Hz, 3H); <sup>13</sup>C NMR (75 MHz, CDCl<sub>3</sub>) δ 145.8, 139.7, 133.9, 130.5, 124.8, 123.7, 123.0, 110.2, 32.2, 31.8, 30.3, 29.9, 29.9, 29.6, 29.5, 29.4, 22.9. 14.4; MS m/z 384 (M<sup>-</sup>).

2-{5-(5-Decylthiophen-2-yl)thiophen-2-yl}-4,4,5,5-tetra methyl-1,3,2-dioxaborolane (4). To a solution of 3 (1 g. 2.64 mmol) in THF (30 mL) was added n-BuLi (1.6 M, 3.17 mmol) at -78 °C under nitrogen condition. The reaction mixture was warmed slowly to -50 °C during 20 min. 2-Isopropoxy-4,4,5.5-tetramethyl-1,3,2-dioxaborolane (0.58 mL, 5.27 mmol) was added at -50 °C and the temperature was increased slowly to r.t. The reaction mixture was stirred for 3 h at r.t and 2N HCl (20 mL) was added. The resulting mixture was extracted with ether (2 × 30 mL), washed with water (100 mL), dried over MgSO<sub>4</sub>, and evaporated under reduced pressure. The obtained residue was recrystallized from hexane (10 mL) to give compound 4 (0.85 g. 93.6%) as a white solid.  $^{1}$ H NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  7.54 (d. J = 3.6Hz, 1H), 7.19 (d. J = 3.6Hz,

1H), 7.07 (d, J = 3.5Hz, 1H), 6.71 (d, J = 3.5Hz, 1H), 2.81 (t, J = 7.6Hz, 2H), 1.70 (m, 2H), 1.37 (m, 14H), 0.91 (t, J =6.6Hz, 3H); <sup>13</sup>C NMR (75 MHz, CDCl<sub>3</sub>) δ 146.1, 144.8. 137.9, 134.7, 124.9, 124.2, 124.1, 84.1, 31.9, 31.6, 30.2, 29.6, 29.5, 29.4, 29.3, 29.1, 24.8, 22.7, 14.2; M\$ m/z 432 (M<sup>+</sup>).

**DBT-DtB-DBT** (16). To a solution of 2,6-dibromobenzo [1.2-b:4.5-b\*]dithiophene 11 (0.52 g, 1.49 mmol) and 4 (1.41 g. 3.27 mmol) in anhydrous THF (20 mL) under nitrogen atmosphere were added Pd(PPh<sub>3</sub>)<sub>4</sub> (0.069 g. 0.059 mmol). Aliquat 8366 (0.34 mL, 0.745 mmol) and Na<sub>2</sub>CO<sub>3</sub> (2 N, 0.80 g. 7.45 mmol) at r.t. The reaction mixture was degassed and stirred at reflux during overnight and then poured into the mixed solution [toluene (200 mL) + water (100 mL) + 1N HCl (20 mL)]. The light orange precipitate was filtered off. washed with water (100 mL), 2N HCl (100 mL), methanol (100 mL) and then with acetone (100 mL) to remove starting material as well as the mono-substituted by-product. The resulting precipitate was purified by Soxhlet to give compound 16 (0.77 g. 65%) as a yellow solid. mp 185 °C; <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  8.67 (s, 2H), 7.60 (s, 2H), 7.32 (d, J = 3.6Hz. 2H), 7.20 (d, J = 3.7Hz, 2H), 7.09 (d, J = 3.5Hz, 2H), 6.75 (d, J = 3.4Hz, 2H), 2.84 (t, J = 7.5Hz, 4H), 1.73 (m, 4H), 1.38 (m, 28H), 0.91 (t. J = 6.4Hz, 6H); MS m/z 798 (M<sup>+</sup>). HRMS(ESI) Calcd for: C<sub>46</sub>H<sub>54</sub>S<sub>6</sub> (M<sup>-</sup>): 798.2550. Found: 798.2546.

**DBT-Anth-DBT** (17). To a solution of 2,6-dibromoanthacene 14 (0.50 g. 1.49 mmol) and 4 (1.41 g. 3.27 mmol) in anhydrous toluene (20 mL) under nitrogen atmosphere were added Pd(PPh<sub>3</sub>)<sub>4</sub> (0.069 g, 0.059 mmol), Aliquat<sup>®</sup>366 (0.34 mL, 0.745 mmol) and Na<sub>2</sub>CO<sub>3</sub> (2N, 0.80 g, 7.45 mmol) at r.t. The reaction mixture was degassed and stirred at reflux during overnight and then poured into the mixed solution [toluene (200 mL) + water (100 mL) + 1 N HCl (20 mL)]. The light orange precipitate was filtered off, washed with water (100 mL), 2N HCl (100 mL), methanol (100 mL) and then with acetone (100 mL) to remove starting material as well as the mono-substituted by-product. The resulting precipitate was purified by Soxhlet to give compound 17 (0.84 g. 72%) as a vellow solid. mp 347 °C; MS m/z 786 (M<sup>-</sup>), HRMS(ESI) Calcd for:  $C_{50}H_{58}S_4$  (MT): 786.3421. Found: 786.3414.

**DBT-Napth-DBT** (18). To a solution of 2,6-dibromonapthalene, 15 (0.43 g, 1.49 mmol) and 4 (1.41 g, 3.27 mmol) in anhydrous toluene (20 mL) under nitrogen atmosphere were added Pd(PPh<sub>3</sub>)<sub>4</sub> (0.069 g, 0.059 mmol), Aliquat <sup>8</sup>366 (0.34 mL, 0.745 mmol) and Na<sub>2</sub>CO<sub>3</sub> (2N, 0.80 g, 7.45 mmol) at r.t. The reaction mixture was degassed and stirred at reflux for 12 h and then poured into the mixed solution [toluene (200 mL) + water (100 mL) + 1N HCl (20 mL)]. The yellow precipitate was filtered off, washed with water (100 mL), 2N

HCl (100 mL), methanol (100 mL) and then with acetone (100 mL) to remove starting material as well as the mono-substituted by-product. The resulting precipitate was purified by Soxhlet to give compound 18 (0.87 g. 79%) as a yellow solid. mp: 302 °C; MS m/z 736 (M<sup>+</sup>), HRMS(ESI) Calcd for:  $C_{46}H_{56}S_4$  (M<sup>+</sup>): 736.3265. Found: 736.3260.
