#### Abstract

Signcryption is a cryptographic primitive that provides authentication (signing) and confidentiality (encrypting) simultaneously at a lower computational cost and communication overhead. With the proposition of certificateless public key cryptography (CLPKC), certificateless signcryption (CLSC) scheme has gradually become a research hotspot and attracted extensive attentions. However, many of previous CLSC schemes are constructed based on time-consuming pairing operation, which is impractical for mobile devices with limited computation ability and battery capacity. Although researchers have proposed pairing-free CLSC schemes to solve the issue of efficiency, many of them are in fact still insecure. Therefore, the challenging problem is to keep the balance between efficiency and security in CLSC schemes. In this paper, several existing CLSC schemes are cryptanalyzed and a new CLSC scheme without pairing based on elliptic curve cryptosystem (ECC) is presented. The proposed CLSC scheme is provably secure against indistinguishability under adaptive chosen-ciphertext attack (IND-CCA2) and existential unforgeability under adaptive chosen-message attack (EUF-CMA) resting on Gap Diffie-Hellman (GDH) assumption and discrete logarithm problem in the random oracle model. Furthermore, the proposed scheme resists the ephemeral secret leakage (ESL) attack, public key replacement (PKR) attack, malicious but passive KGC (MPK) attack, and presents efficient computational overhead compared with the existing related CLSC schemes.

Keywords: certificateless; ECC; pairing-free; signcryption; random oracle

[^0]
## 1. Introduction

Traditional public key infrastructure (TPKI) cryptosystem[1], which suffers from complicated public key certificate management, is impractical for mobile devices with limited computation ability and battery capacity. An effective substitution for traditional PKI cryptosystem without the operation of certificate is identity-based (ID-based) cryptosystem initially proposed by Shamir[2], in which the public key of the user is easily computed from the identity of the user such as IP address or email address, while the private key is generated from the identity of the user and a master secret key of a key generator center (KGC) known as a trusted authority. To reduce the heavy trust reliance on KGC, in 2003, Al-Riyami and Paterson[3] presented a novel concept called certificateless public key cryptography (CLPKC), in which long-term private key of the user is calculated from a secret key of the user, while partial private key of the user is issued by KGC. In this way, CLPKC-based protocols eliminate the complex certificate management burden and the insecure key escrow problem, which respectively consists in TPKI and ID-based cryptosystems.

In information and network applications, encryption technique and digital signature are two fundamental mechanisms explored to match specific security requirements, including confidentiality, integrity, non-repudiation and authentication. Traditionally, signing and encrypting the message are independent with an encrypt-then-sign paradigm. Signcryption, put forward by Zheng [4] in 1997, is a cryptographic primitive that provides authentication (signing) and confidentiality (encrypting) simultaneously, at a lower computational cost and communication overhead. Previously, researchers constructed signcryption schemes based on TPKI and ID-based cryptosystems. Recently, the explosive growth of security and performance requirements has necessitated extensive researches on certificateless signcryption (CLSC) schemes owing to the satisfactory performances of CLPKC.

### 1.1. Related studies

Certificateless signcryption (CLSC) schemes can be divided into two categories according to the way of computing in the schemes, (1) Pairing-based CLSC schemes, (2) Pairing-free CLSC schemes.

CLSC scheme was firstly put forward by Barbosa and Farshim [5] in 2008 and previous CLSC schemes were relying on costly bilinear pairing operations. In traditional pairing-based CLSC schemes, a particular collection of a message part is required to be signcrypted and sent. That means a large message should be divided into several sections, each of which should match the size of input for signcryption in signcrypt algorithm. Hereafter, many traitional CLSC schemes [6-13] relying on pairing operations have been proposed. In 2008, Aranha et al. [6] and Wu et al. [7] proposed two schemes separately. In 2010, Liu et al. [9] figured out that Barbosa and Farshim's CLSC scheme [5] was insecure under malicious but passive KGC (MPK) attack [14] and constructed an improved one, which was unfortunately proved to be insecure against MPK attack either, as indicated by Weng et al. [15]. That same year, Selvi et al. also demonstrated security weaknesses of the schemes [5-7] in their literature [16]. Compared with CLSC schemes [7] and [9], Xie et al. [8] improved a more efficient one, which was, however, vulnerable to ephemeral secret leakage (ESL) attack [17], as analyzed by Hafizul Islam et al.[10], who then proposed a leakage-free CLSC scheme with security against ESL attack in the random oracle model in 2015.

Besides, there were some untraditional pairing-based CLSC schemes proposed by reseachers. In 2013, Li et al. [11] generated a novel hybrid CLSC scheme, in which a message should not be divided into appropriate sections. In such a construction, a symmetric key, which will be used to encrypt the actual message later, is signcrypted and sent from the signer. It is worthwhile to analyze such different paradigm from traditional research works, because a signcrypt algorithm is also adopted in their schemes. A symmetric key is signcrypted in such special schemes, while a section of the message is signcryped in traditional ones. In addition, in 2014, Zhou et al. [12] introduced a provable certificateless generalized signcryption scheme, which could adaptively work as an encryption scheme, a signature scheme or a signcryption scheme with only one algorithm. Such algorithms running in signcryption mode, which are equivalent to the traditional CLSC schemes, are also worth discussing in our research works.With studies on the two schemes above, Yin et al. [13] demonstrated that these two schemes were inefficient with higher computation cost compared with their own proposed improved scheme.

Nevertheless, all CLSC schemes mentioned above are relying on costly bilinear pairing operations, which are impractical for mobile devices with limited computation ability and battery capacity.

Therefore, it is significant and challenging to come up with secure and efficient pairing-free CLSC schemes, which provide more security properties without complicated operations. In 2010, Selvi et al.[16] presented the first provably secure CLSC scheme without bilinear pairing and validated it in the random oracle model. Among the existing pairing-free CLSC schemes [18-20], He [21] claimed that scheme [19] failed to achieve unforgeability property when the Type I adversary executed attacks. In 2014, Shi et al. [22] claimed that all the CLSC schemes in [18-20] provided neither unforgeability nor confidentiality property against the Type I adversary. Moreover, in 2014, Lu et al. [23] proposed a certificate-based signcryption scheme without costly bilinear operations. The ceriticate produced by the Certify algorithm in their scheme is equivalent to the partial private key produced by the Extract Partial Private Key algorithm in traditional CLSC schemes. Lu et al. claimed that the ceriticates could be sent to the users publicly, which resolved the distribution problem in CLPKC. However, security model in their scheme includes a Type I adversary who has no access to the certificates, which is contradictory to the Certify algorithm. In fact, Lu et al.'s scheme is an implicit CLSC scheme.

Some recent research works on pairing-based and pairing-free CLSC schemes are summarized in Fig. 1 and Fig. 2 respectively. Researchers at the end of the arrow indicated that the schemes proposed by the researchers at the beginning of the arrow was either insecure or incorrect. Besides, there was no impoved CLSC schemes presented in [15] and [21].

### 1.2. Our contribitions

In this paper, we analyze schemes [11-13, 16, 22] by concrete cryptanalysis. All these schemes are vulnerable to ephemeral secret leakage (ESL) attack, public key replacement (PKR) attack, malicious but passive KGC (MPK) attack, and not secure enough to provide confidentiality or unforgeability property. Motivated by the prior research works, we construct a secure and efficient pairing-free CLSC scheme based on ECC. Compared with existing CLSC schemes, our proposed scheme achieves greater security with lower computation cost.

## 2. Preliminaries

### 2.1. Security assumption based on ECC

Let $F_{p}$ be a finite prime field with a large prime number $p$. An elliptic curve $E$ over the finite field $F_{p}$ is the set of all pairs satisfying the equation $y^{2}(\bmod p)=x^{3}+a x+b(\bmod p)$, $a, b \in F p, \Delta=4 a^{3}+27 b^{2}(\bmod p) \neq 0$, along with an imaginary point representing the infinity. An additive group $G_{p}$ of all points on elliptic curve $E$ includes addition operation.

Let $P$ be a generator of $G_{p}$. Let the order of $G_{p}$ be an integer $q$. Let $Z_{q}^{*}=[1, q-$ 1]. Following computational problems over the elliptic curve $E$ are frequently used in cryptographic protocols. The probability to solve these problems is negligible with any polynomial time algorithm.
Discrete Logarithm (DL) problem: for unknown $a \in Z_{q}^{*}$, by giving $P, a P, P \in E / F p$, compute $a$.
Computational Diffie-Hellman (CDH) problem: for unknown $a, b \in Z_{q}^{*}$, by giving $P, a P, b P, P \in E / F p$, compute $a b P$.
Decision Diffie-Hellman (DDH) problem: for unknown $a, b, c \in Z_{q}^{*}$, by giving $P, a P, b P, c P, P \in E / F p$, decide whether $a b P=c P$.

Gap Diffie-Hellman (GDH) problem: for unknown $a, b \in Z_{q}^{*}$, by giving $P, a P, b P, P \in$ $E / F p$ and an oracle $\operatorname{DDH}(a P, b P, c P)$, that outputs 1 if $a b P=c P$, otherwise 0 , compute $a b P$.

### 2.2. Structure of CLSC schemes

Notions used in this paper are listed in Table 1. CLSC scheme, which consists of seven polynomial time algorithms, can be summarized in Table 2 according to the following expression.

$$
\{\text { outputs\} } \stackrel{\text { algorithm executive }}{\rightleftarrows} \text { algorithm(inputs) }
$$

Table 1. Notations used in this paper

| Notation | Description |
| :---: | :---: |
| $I D_{i}$ | the identity of participant $i$ |
| $H(*)$ | secure collision-free one-way hash functions |
| $\left(s, P_{p u b}\right)$ | the KGC's master secret key/public key pair |
| $\left(x_{i}, P_{i}\right)$ | secret value/public key pair of participant $i, P_{i}$ is calculated from $x_{i}$ |
| $d_{i}$ | $d_{i}$ is the partial private key of participant $i$ |
| $r_{i}$ | a random number generated by sender $i$ (i.e. ephemeral private key) for signcryption |
| $\left(s k_{i}, p k_{i}\right)$ | private key/public key pair of participant $i$, where $s k_{i}=\left(x_{i}, d_{i}\right), p k_{i}=\left(P_{i}\right)$ |
| $k$ | security parameter set by KGC |
| $m / \sigma$ | message plaintext / ciphertext with $k$ bits |
| $\perp$ | represents no message or an unknown value |

For example, $\left\{p k_{i}\right\} \stackrel{\text { user } i}{\longleftarrow} \operatorname{PUK}\left(I D_{i}, x_{i}\right.$, system params $)$ means that user $i$ executes PUK algorithm to generate public key $p k_{i}$ by taking $I D_{i}, x_{i}$, system params as inputs.

Table 2. Algorithms of a CLSC scheme

| Algorithm Name(Abbreviation) | Expression |
| :---: | :---: |
| setup(SETUP) | $\{s, \text { system params }\}\} \stackrel{K G C}{\longleftrightarrow} \operatorname{SETUP}(k)$ |
| Extract Partial Private Key (EPRK) | $\left\{d_{i}\right\} \stackrel{\text { KGC }}{\longleftarrow} \operatorname{EPRK}\left(s, I D_{i}\right.$, system params $)$ |
| Set Secret Value(SV) | $\left\{x_{i}\right\} \stackrel{\text { user } i}{\longleftrightarrow} \mathrm{SV}\left(I D_{i}\right.$, system params $)$ |
| Set Private Key(PRK) | $\left\{s k_{i}\right\} \stackrel{\text { user } i}{\leftarrow} \operatorname{PRK}\left(d_{i}, x_{i}\right)$ |
| Set Public Key(PUK) | $\left\{p k_{i}\right\} \stackrel{\text { user } i}{\longleftrightarrow}$ PUK (ID ${ }_{i}, x_{i}$, system params $)$ |
| Signcrypt (SC) | $\{\sigma\} \stackrel{\text { sender } i}{\longleftrightarrow} \mathrm{SC}\left(m, I D_{i}, s k_{i}, p k_{i}, I D_{j}, p k_{j}\right.$, system params $)$ |
| Unsigncrypt (USC) | $\{m \text { or } \perp\} \begin{array}{r} \text { receiver } j \\ \\ U S C \\ \left(\sigma, I D_{i}, p k_{i}, I D_{j}, s k_{j}, p k_{j}\right) \end{array}$ |

### 2.3. Security model

### 2.3.1 Adversary model

There are two kinds of adversaries in CLPKC. $\mathcal{A}_{1}$, as a dishonest user, can replace the public key of any user with a value $x_{i}$ of his choice, but cannot access the master secret key of KGC. $\mathcal{A}_{2}$, as a malicious but passive KGC, cannot replace the public keys, but can obtain the master secret key of KGC.

### 2.3.2 Security model

The security model is defined as an attack game between an adversary $\mathcal{A} \in\left\{\mathcal{A}_{1}, \mathcal{A}_{2}\right\}$ and a challenger C in a series of simulated potential attacking scenarios. The adversary, simulated as a user, asks the challenger for a polynomial number of queries, while the challenger issues the replies using the following oracles.
(1) Create $\left(I D_{i}\right)$ : C generates private key/public key pair $\left(s k_{i}, p k_{i}\right)$ of participant $i$.
(2) $\mathrm{R} d_{i}$ : C reveals to $\mathcal{A}$ the partial private key $d_{i}$ of participant $i$.
(3) $\mathrm{R} x_{i}: \mathcal{C}$ reveals to $\mathcal{A}$ the secret value $x_{i}$ of participant $i$.
(4) Rsk $i_{i}$ : reveals to $\mathcal{A}$ the private key $\left(d_{i}, x_{i}\right)$ of participant $i$.
(5) $\mathrm{Rp} k_{i}$ : C replaces the public key of participant $i$ with the value $x_{i}$ chosen by $\mathcal{A}$, which means that the secret values of all participants can be set by $\mathcal{A}$.
(6) $\mathrm{R} r_{i}: C$ reveals to $\mathcal{A}$ the ephemeral private key $r_{i}$ of participant $i$.
(7) $\mathrm{R}_{s c}\left(m, I D_{i}, I D_{j}\right)$ : With the identity of the sender $I D_{i}$, the identity of the receiver $I D_{j}$ and the message $m, C$ executes signcryption algorithm and outputs $\sigma$ or $\perp$.
(8) $\mathrm{R}_{\text {usc }}\left(\sigma, I D_{i}, I D_{j}\right)$ : With the identity of the sender $I D_{i}$, the identity of the receiver $I D_{j}$ and the ciphertext $\sigma$, C executes unsigncryption algorithm and outputs $m$ or $\perp$.

Definition 1 (Confidentiality): A CLSC scheme satisfies confidentiality against indistinguishability under adaptive chosen-ciphertext attack (IND-CCA2) only if the probability for attackers to win the following game is negligible with any polynomial time algorithm.

Steps of the Game IND-CCA2 are described as follows.
(C1) The challenger $C$ executes the SETUP algorithm in the CLSC scheme. For adversary $\mathcal{A}_{1}$, the challenger C sends system params to $\mathcal{A}_{1}$ but keeps $s$ in secret. For adversary $\mathcal{A}_{2}$, the challenger C sends system params and $s$ to $\mathcal{A}_{2}$.
(C2) The adversary asks the challenger C for a polynomial number of the queries.
(C3) The adversary chooses accepted sender $I D_{S}{ }^{*}$, accepted receiver $I D_{R}{ }^{*}$ (defined in Definition 2 and 3 below) and two random messages $m_{0}, m_{1}$ to ask a challenging. The challenger $C$ picks randomly $b \in\{0,1\}$ and computes $\sigma^{*}$. Then $C$ returns $\sigma^{*}$ to $\mathcal{A}$.
(C4) The adversary asks queries as done in step (C2), keeping $I D_{S}{ }^{*}$ and $I D_{R}{ }^{*}$ being accepted.
(C5) When terminating the game, $\mathcal{A}\left(\mathcal{A}_{1}\right.$ or $\left.\mathcal{A}_{2}\right)$ makes a guess bit $b^{\prime}$. If $b^{\prime}=b$, $\mathcal{A}$ wins the game.

The advantage of $\mathcal{A}$ for winning the game is defined as $I N D_{-} A d v_{A}(k)=\left|\operatorname{pr}\left[b=b^{\prime}\right]-\frac{1}{2}\right|$.
Definition 2 (acceptable sender and receiver against $\mathcal{A}_{1}$ for confidentiality). For $\mathcal{A}_{1}, \mathrm{R} x_{S}$, $\mathrm{Rp} k_{S}, \mathrm{R} x_{R}$ and $\mathrm{Rp} k_{R}$ are always accepted. Then, the sender and receiver are accepted if none of the following condition holds.
(1) $\mathcal{A}_{1}$ either raises the query $\mathrm{Rs} k_{R}$ or $\mathrm{R} d_{R}$.
(2) $\mathcal{A}_{1}$ either asks the query $R s k_{s}$ or $R d_{s}$.
(3) $\mathcal{A}_{1}$ raises query $\mathrm{R}_{u s c}\left(\sigma^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$.

Definition 3 (acceptable sender and receiver against $\mathcal{A}_{2}$ for confidentiality). For $\mathcal{A}_{2}, \operatorname{R} d_{S}$, and $\mathrm{R} d_{R}$ are always accepted. The sender and receiver are accepted if none of the following condition holds.
(1) $\mathcal{A}_{2}$ either raises the query $\mathrm{R} s k_{R}$ or $\mathrm{R} x_{R}\left(\mathrm{Rp} k_{R}\right)$.
(2) $\mathcal{A}_{2}$ either asks the query $\mathrm{Rs} k_{s}$ or $\mathrm{R} x_{S}\left(\mathrm{Rp} k_{S}\right)$.
(3) $\mathcal{A}_{2}$ raises query $\mathrm{R}_{u s c}\left(\sigma^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$.

Definition 4 (Unforgeability): A CLSC scheme is secure against unforgeability under adaptive chosen-messages attacks (EUF-CMA) only if the probability for attackers to win the following game is negligible with any polynomial time algorithm.

Steps of the Game EUF-CMA are described as follows.
(U1), (U2) The same as the steps (C1) and (C2) in Game IND-CCA2.
(U3) The adversary chooses accepted sender $I D_{S}{ }^{*}$ (defined in Definition 5 and 6 below) and a user $I D_{j}{ }^{*}$, outputs $\sigma^{*}$ on a chosen messages $m^{*}$.
(U4) C executes unsigncryption algorithm with input as $\left(\sigma^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$. If C outputs $m=m^{*}, \mathcal{A}$ wins the game.

The advantage of $\mathcal{A}$ for winning the game is defined as $E U F_{-} A d v_{A}(k)=\mid p r\left[m=m^{*}\right]-$ $\left.\frac{1}{2} \right\rvert\,$.

Definition 5 (acceptable sender against $\mathcal{A}_{1}$ for unforgeability). For $\mathcal{A}_{1}, \mathrm{R} x_{S}$ and $\mathrm{Rp} k_{S}$ are always accepted. The sender is accepted if none of the following condition holds.
(1) $\mathcal{A}_{1}$ either raises the query $R s k_{s}$ or $R d_{s}$.
(2) $\left(\sigma^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$ is not produced by signcryption algorithm with $\left(m^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$.

Definition 6 (acceptable sender against $\mathcal{A}_{2}$ for unforgeability). For $\mathcal{A}_{2}, \mathrm{R} d_{S}$ and $\mathrm{R} d_{R}$ are always accepted. The sender is accepted if none of the following condition holds.
(1) $\mathcal{A}_{2}$ either raises the query $\mathrm{Rs} k_{S}$ or $\mathrm{R} x_{S}\left(\mathrm{Rp} k_{S}\right)$.
(2) $\left(\sigma^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$ is not produced by signcryption algorithm with $\left(m^{*}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$.

Definition 7 (public key replacement (PKR) attack). A CLSC scheme resists public key replacement attack only if $\mathcal{A}_{1}$ cannot win Game IND-CCA2 and Game EUF-CMA.

Definition 8 (malicious but passive KGC (MPK) attack). A CLSC scheme resists malicious but passive KGC attack only if $\mathcal{A}_{2}$ cannot win Game IND-CCA2 and Game EUF-CMA.

Definition 9 (ephemeral secret leakage (ESL) attack). A CLSC scheme resists ESL attack means that even if the attacker $\mathcal{A}_{1}$ or $\mathcal{A}_{2}$ is allowed to ask $\mathrm{R} r_{i}$ query, he cannot win Game IND-CCA2 and Game EUF-CMA.

### 2.3.3 Security definition

Definition 10 (secure CLSC scheme). A CLSC scheme is secure when it matches the following conditions.
(1) The sender generates the ciphertext $\sigma$ with private keys of his own and public keys of the receiver, and the receiver recovers the correct plaintext $m$ from $\sigma$ with private keys of his own and public keys of the sender. Such correctness of a CLSC scheme can be defined as the following.

$$
m=\operatorname{USC}\left(\operatorname{SC}\left(m, I D_{i}, s k_{i}, p k_{i}, I D_{j}, p k_{j}, \text { system params }\right), I D_{i}, p k_{i}, I D_{j}, s k_{j}, p k_{j}\right)
$$

(2) $I N D_{-} A d v_{A}(k)$ is negligible.
(3) $E U F_{-} A d v_{A}(k)$ is negligible.

## 3. Analysis on related CLSC schemes

In this section, we demonstrate the security weaknesses of several existing CLSC schemes. We find that all of them are vulnerable to ESL attack, MPK attack, PKR attack and fail to provide confidentiality and unforgeability under our security model.

### 3.1. Analysis on scheme [12] and [11]

Scheme [12] is briefly described as follows.
Setup: KGC chooses $s \in Z_{q}^{*}$ and computes $P_{p u b}=s P$.
SetSecretValue: The user randomly chooses $x_{i} \in Z_{q}^{*}$, makes $P K_{i}=x_{i} P$ as public key.
ExtractPartialPrivateKey KGC computes partial private key as $d_{i}=s Q_{i}=s H_{1}\left(I D_{i}\right)$.
SetPrivateKey The user owns ( $x_{i}, d_{i}$ ) as private key.
SetPublicKey The user owns $P K_{i}$ as public key.

## Signcrypt

In their scheme, when $I D_{S} \notin \emptyset, I D_{R} \notin \emptyset$, then $f\left(I D_{S}\right)=f\left(I D_{R}\right)=1$, algorithm runs in signcryption mode. The signer computes the ciphertext $c=(U, V, W)$ in the signcryption phase as follows:

The signer computes $r \in Z_{q}^{*}, U=r P, w=e\left(P_{p u b}, Q_{R}\right)^{r}, h=H_{2}\left(U, w, r P K_{R}, I D_{S}, P K_{S}\right.$, $\left.I D_{R}, P K_{R}\right), V=m \oplus h, H=H_{3}\left(U, V, I D_{S}, P K_{S}, I D_{R}, P K_{R}\right), H^{\prime}=H_{4}\left(U, V, I D_{S}, P K_{S}, I D_{R}\right.$, $\left.P K_{R}\right), W=d_{S}+r H+x_{S} H^{\prime}$.

## Attacks

The attacker, who gets the ephemeral private key $r$ with query $\mathrm{R} r_{s}$, can compute $h$ and get the message with $m=V \oplus h$. $\mathcal{A}_{1}$ can compute the partial private key as $d_{S}=W-r H-x_{S} H^{\prime}$ with queries $\mathrm{R} r_{S}$ and $\mathrm{R} x_{S}, \mathcal{A}_{2}$ can compute the secret key as $x_{S}=\left(W-d_{S}-r H\right) / H^{\prime}$ with
queries $R r_{S}$ and $R d_{S}$.
Based on the proof above, scheme [12] cannot withstand ESL attack, MPK attack, PKR attack and fails to provide confidentiality and unforgeability.

Most phases in scheme [11] and [12] are the same. Similarly, Scheme [11] is insecure when the attacker knows random numbers $r$ and $\tau$.

### 3.2. Analysis on scheme [13]

Scheme [13] is briefly described as follows.
Setup: KGC chooses $s \in Z_{q}^{*}$ and computes $P_{p u b}=s P$.
SetSecretValue: The user randomly chooses $x_{i \in Z_{q}^{*}}$, makes $P K_{i}=x_{i} P$ as public key.
ExtractPartialPrivateKey: KGC computes $d_{i}=s Q_{i}, Q_{i}=H_{1}\left(I D_{i} \| P K_{i}\right)$.
SetPrivateKey The user owns ( $x_{i}, d_{i}$ ) as private key.

## Signcrypt

In [13], the signer computes the ciphertext $\sigma=(\tau, h, W, T)$ in the signcryption phase as follows:

Choose $r_{1}, r_{2} \in Z_{q}^{*}$, compute $R_{1}=r_{1} P, R_{2}=r_{2} P, Q_{R}=H_{1}\left(I D_{R} \| P K_{R}\right)$.
Compute $U=r_{1} P K_{R}, V=e\left(r_{2} Q_{R}, P_{\text {pub }}\right) P, K=H_{2}\left(I D_{S}, I D_{R}, R_{1}, R_{2}, U, V\right), \tau=E n k_{K}(m)$.
Compute $h=H_{3}\left(\tau, I D_{S}, I D_{R}, P K_{S}, P K_{R}, R_{1}, R_{2}, U, V\right), W=h\left(d_{S}+r_{2} Q_{S}\right), T=h x_{S}+r_{1}$.

## Attack

The attacker, who gets the ephemeral private keys $r_{1}, r_{2}$ with query $\mathrm{R} r_{s}$, can compute the symmetric key $K$ and get the message $m=\operatorname{Dek}_{K}(\tau) . \mathcal{A}_{1}$ can compute the partial private key as $d_{S}=h^{-1} W-r_{2} Q_{S}$ with queries $\mathrm{R} r_{s} . \mathcal{A}_{2}$ can compute the secret key as $x_{S}=h^{-1}\left(T-r_{1}\right)$ with queries $\mathrm{Rr} r_{s}$.

Scheme [13], which cannot withstand ESL attack, MPK attack and PKR attack, fails to provide confidentiality and unforgeability.

### 3.3. Analysis on scheme [16]

Scheme [16] is briefly described as follows.
Setup: KGC computes $g_{p u b}=g^{s}$, in which $s$ is the master private key of KGC, $g_{p u b}$ is the public key of KGC.

SetSecretValue: The user randomly chooses $y_{i}$, makes $Y_{i}=g^{y_{i}}$ as public key.
ExtractPartialPrivateKey KGC randomly chooses $x_{i 0}, x_{i 1}$, computes $X_{i 0}=$ $g^{x_{i 0}, X_{i 1}}=g^{x_{i 1}}, q_{i 0}=H_{1}\left(I D_{i}, X_{i 0}\right), q_{i 1}=H_{1}\left(I D_{i}, X_{i 0}, X_{i 1}\right), d_{i 0}=x_{i 0}+s q_{i 0}, d_{i 1}=x_{i 1}+$ $s q_{i 1} . d_{i 0}$ is set as partial private key.

SetPrivateKey The user owns $\left(y_{i}, d_{i 0}\right)$ as private key.
SetPublicKey The user owns $P K_{i}=\left(d_{i 1}, X_{i 0}, X_{i 1}, Y_{i}\right)$ as public key.
The signer computes the ciphertext $C=\left(c_{1}, c_{2}, c_{3}\right)$ in the signcryption phase as follows:

## Signcrypt

The signer Chooses the ephemeral private keys $r_{1}, r_{2} \in Z_{q}^{*}$, computes $c_{1}=g^{r_{1}}, c_{2}=$ $g^{r_{2}}, k_{1}=\left(Y_{R}\right)^{r_{1}}, k_{2}=\left(\left(X_{R 0}\right) g_{p u b}{ }^{q_{R 0}}\right)^{r_{1}}, d=H_{3}\left(m, c_{2}, I D_{S}, I D_{R}, P K_{S}\right), e=$ $H_{5}\left(m, c_{2}, I D_{S}, I D_{R}, P K_{S}\right), v=d \cdot d_{S 0}+e \cdot y_{S}+r_{2}, c_{3}=H_{4}\left(k_{1}, k_{2}, I D_{S}, I D_{R}\right) \oplus\left(m\left\|r_{1}\right\| v\right)$.

## Attack

This scheme was insecure due to the computation of $c_{3}$. Suppose that the attacker gets the ephemeral private keys $r_{1}, r_{2}$ with query $\mathrm{R} r_{s}$, he can compute $c_{1}, c_{2}, k_{1}, k_{2}$ and get $m\left\|r_{1}\right\| v=c_{3} \oplus H_{4}\left(k_{1}, k_{2}, I D_{S}, I D_{R}\right)$. Since the attacker knows $r_{1}$, he can easily extract the message $m$ and $v$ in $m\left\|r_{1}\right\| v$. Then, $\mathcal{A}_{1}$ can compute the partial private key as $d_{S 0}=$
$\frac{v-r_{2}-e \cdot y_{S}}{d}$ with queries $\mathrm{R} r_{S}$ and $\mathrm{R} y_{S} . \mathcal{A}_{2}$ can compute the secret key as $y_{S}=\frac{v-r_{2}-d \cdot d_{S 0}}{e}$ with queries $\mathrm{R} r_{s}$ and $\mathrm{R} d_{s o}$.

Scheme [16], which cannot withstand ESL attack, MPK attack and PKR attack, fails to provide confidentiality and unforgeability.

### 3.4. Analysis on scheme [22]

Scheme [22] is briefly described as follows.
Setup: KGC computes $y=g^{x} \bmod p$, in which $x$ is the master private key of KGC, $y$ is the public key of KGC.

SetSecretValue: The user randomly chooses $x_{i}$, makes $P_{i}=g^{x_{i}}$ as public key.
ExtractPartialPrivateKey KGC randomly chooses $r_{i}$, computes $R_{i}=g^{r_{i}}, s_{i}=r_{i}+$ $x H_{1}\left(I D_{i}, R_{i}\right)$.

SetPrivateKey The user owns ( $x_{i}, d_{i}$ ) as private key.
SetPublicKey The user owns ( $P_{i}, R_{i}$ ) as public key.
The signer computes the ciphertext $C=\left(c_{1}, c_{2}, c_{3}\right)$ in the signcryption phase as follows:

## Signcrypt

The signer Chooses $r_{S}$, compute $c_{1}=g^{r_{S}} \bmod p, k_{S}=H_{2}\left(I D_{S}, P_{S}, R_{S}, y\right)$, $k_{R}=H_{2}\left(I D_{R}, P_{R}, R_{R}, y\right), h_{R}=H_{1}\left(I D_{R}, R_{R}\right), \xi=\left(P_{R}{ }^{k_{R}} R_{R} y^{h_{R}}\right)^{r_{S}} \bmod p, c_{2}=H_{3}(\xi) \oplus m$, $h=H_{4}\left(I D_{S}, P_{S}, R_{S}, c_{1}, \mathrm{c}_{2}, \xi, m\right), c_{3}=\left[\left(k_{S} x_{S}+d_{S}\right) /\left(r_{S}+h\right)\right] \bmod q$.

## Attack

The attacker, who gets the ephemeral private keys $r_{S}$ with query $\mathrm{R} r_{S}$, can compute the message $m$ with $\xi=\left(P_{R}{ }^{k_{R}} R_{R} y^{h_{R}}\right)^{r_{S}} \bmod p$ and $m=H_{3}(\xi) \oplus c_{2} . \mathcal{A}_{1}$ can compute the partial private key as $d_{S}=c_{3}\left(r_{S}+h\right)-k_{S} x_{S}$ with queries $\mathrm{R} r_{S}$ and $\mathrm{R} x_{S} . \mathcal{A}_{2}$ can compute the secret key as $x_{S}=\left(c_{3}\left(r_{S}+h\right)-d_{S}\right) / k_{S}$ with queries $\mathrm{R} r_{S}$ and $\mathrm{R} d_{S}$.

Scheme [22], which cannot withstand ESL attack, MPK attack and PKR attack, fails to provide confidentiality and unforgeability.

## 4. Our proposed CLSC scheme

Motivated by the structure of previous CLSC schemes, we propose a novel CLSC scheme without pairing based on ECC as shown in Fig. 3. Our scheme consists of two phases: registration, signcrypt \&unsigncrypt.

Fig. 3. Our proposed pairing-free CLSC schemes
(1)Registration phase

Setup: KGC chooses $s \in Z_{q}^{*}$ and computes $P_{p u b}=s P$.
SetSecretValue: The user randomly chooses $x_{i} \in Z_{q}^{*}$, makes $P_{i}=x_{i} P$ as public key.
ExtractPartialPrivateKey KGC randomly chooses $t_{i} \in Z_{q}^{*}$, computes $T_{i}=t_{i} P, l_{i}=$ $H_{0}\left(I D_{i}, T_{i}, P_{i}\right) \in(0,1)^{k}, d_{i}=\left(t_{i}+s l_{i}\right) \bmod q . d_{i}$ is set as partial private key.

SetPrivateKey The user owns $\left(x_{i}, d_{i}\right)$ as private key.
SetPublicKey The user owns $P K_{i}=\left(P_{i}, T_{i}\right)$ as public key.
The user verifies whether $d_{i} P=T_{i}+H_{0}\left(I D_{i}, T_{i}, P_{i}\right) P_{\text {pub }}=Q_{i}$ or not.

## (2) Signcrypt \&Unsigncrypt phase

## Signcrypt

The signer chooses randomly $r_{S} \in Z_{q}^{*}$, computes
$R=r_{S}\left(H_{4}\left(I D_{S}, P_{S}\right) Q_{S}+H_{4}\left(I D_{R}, P_{R}\right) P_{S}\right), Q_{R}=T_{R}+H_{0}\left(I D_{R}, T_{R}, P_{R}\right) P_{p u b}$,
$Y=r_{S}\left(d_{S}\left(H_{4}\left(I D_{S}, P_{S}\right)+x_{S} H_{4}\left(I D_{R}, P_{R}\right)\right)\left(H_{4}\left(I D_{S}, P_{S}\right) Q_{R}+H_{4}\left(I D_{R}, P_{R}\right) P_{R}\right)\right.$,
$c=m \oplus H_{1}(Y), H=H_{2}\left(m, c, R, Y, Q_{S}, Q_{R}\right), J=H_{3}\left(m, c, R, Y, P_{S}, P_{R}\right)$,
$S=r_{S}\left(d_{S} H_{4}\left(I D_{S}, P_{S}\right)+x_{S} H_{4}\left(I D_{R}, P_{R}\right)\right)+d_{S} H+x_{S} J$.
Then, the signer transmits ciphertext $\sigma=(c, R, S)$ to the receiver.

## Unsigncrypt

After receiving $\sigma=(c, R, S)$, the receiver executes the unsigncryption algorithm as follows.
The receiver computes $Q_{S}=T_{S}+H_{0}\left(I D_{S}, T_{S}, P_{S}\right) P_{p u b} \quad, Y=R\left(d_{R}\left(H_{4}\left(I D_{S}, P_{S}\right)+\right.\right.$ $\left.x_{R} H_{4}\left(I D_{R}, P_{R}\right)\right), m=c \oplus H_{1}(Y), H=H_{2}\left(m, c, R, Y, Q_{S}, Q_{R}\right), J=H_{3}\left(m, c, R, Y, P_{S}, P_{R}\right)$,

The receiver will accept $m$ if $S P=R+H Q_{S^{+}} J P_{S}$ holds.

## 5. Analysis of our proposed CLSC scheme

### 5.1. Security analysis

According to the definition in section 2.3.3, our CLSC scheme is secure under the GDH assumption and DL problem.

Theorem 1 Our scheme is correct.
Proof. Our scheme is correct because of the following.
After receiving $\sigma=(c, R, S)$, the receiver computes $Q_{S}=T_{S}+H_{0}\left(I D_{S}, T_{S}, P_{S}\right) P_{\text {pub }}=$

$$
d_{S} P
$$

$$
Y=R\left(d_{R}\left(H_{4}\left(I D_{S}, P_{S}\right)+x_{R} H_{4}\left(I D_{R}, P_{R}\right)\right)\right.
$$

$$
=r_{S}\left(H_{4}\left(I D_{S}, P_{S}\right) Q_{S}+H_{4}\left(I D_{R}, P_{R}\right) P_{S}\right)\left(d_{R}\left(H_{4}\left(I D_{S}, P_{S}\right)+x_{R} H_{4}\left(I D_{R}, P_{R}\right)\right)\right.
$$

$=r_{S}\left(H_{4}\left(I D_{S}, P_{S}\right) d_{S}+H_{4}\left(I D_{R}, P_{R}\right) x_{S}\right)\left(d_{R}\left(H_{4}\left(I D_{S}, P_{S}\right)+x_{R} H_{4}\left(I D_{R}, P_{R}\right)\right) P\right.$
$=r_{S}\left(H_{4}\left(I D_{S}, P_{S}\right) d_{S}+H_{4}\left(I D_{R}, P_{R}\right) x_{S}\right)\left(\left(H_{4}\left(I D_{S}, P_{S}\right) Q_{R}+H_{4}\left(I D_{R}, P_{R}\right) P_{R}\right)\right.$
So, the receiver recovers $m$ with $m=c \oplus H_{1}(Y)$.
Then, the receiver verifies $m$ with

$$
\begin{aligned}
& H=H_{2}\left(m, c, R, Y, Q_{S}, Q_{R}\right), J=H_{3}\left(m, c, R, Y, P_{S}, P_{R}\right) \\
& S P=\left(r_{S}\left(d_{S} H_{4}\left(I D_{S}, P_{S}\right)+x_{S} H_{4}\left(I D_{R}, P_{R}\right)\right)+d_{S} H+x_{S} J\right) P \\
& \quad=\left(r_{S}\left(d_{S} P H_{4}\left(I D_{S}, P_{S}\right)+x_{S} P H_{4}\left(I D_{R}, P_{R}\right)\right)+d_{S} P H+x_{S} P J\right) \\
& \quad=r_{S}\left(H_{4}\left(I D_{S}, P_{S}\right) Q_{S}+H_{4}\left(I D_{R}, P_{R}\right) P_{S}\right)+H Q_{S}+J P_{S} \\
& \quad=R+H Q_{S}+J P_{S} .
\end{aligned}
$$

Theorem 2 Our scheme provides confidentiality under the GDH assumption.
This theorem can be derived from the Lemma1 and Lemma 2.
Suppose $H_{0}\left({ }^{*}\right), H_{1}\left({ }^{*}\right), H_{2}\left(^{*}\right), H_{3}\left({ }^{*}\right), H_{4}\left(^{*}\right)$ are random oracles owned by C. Assume that $\mathcal{A}_{1}$ makes at most $q_{i}$ queries to $H_{i}(0 \leq i \leq 4)$ respectively, $q_{c}$ queries to Create $\left(I D_{i}\right), q_{d}$ queries to $\mathrm{R} d_{i}, q_{x}$ queries to $\mathrm{R} x_{i}, q_{p k}$ queries to $\mathrm{Rp}_{i}, q_{s k}$ queries to $\mathrm{R} s k_{i}, q_{r}$ queries to $\mathrm{R} r_{i}$, $q_{s c}$ queries to $\mathrm{R}_{s c}$ and $q_{u s c}$ queries to $\mathrm{R}_{u s c}$. Assume also that bounded running time of query $H_{i}(0 \leq i \leq 4)$ is $t_{i}$, Create $\left(I D_{i}\right)$ is $t_{c}, \mathrm{Rd}_{i}$ is $t_{d}, \mathrm{R} x_{i}$ is $t_{x}, \mathrm{Rp}_{i}$ is $t_{p k}, \mathrm{Rs}_{i}$ is $t_{s k}, \mathrm{Rr}_{i}$ is $t_{r}$, $\mathrm{R}_{s c}$ is $t_{s c}$ and $\mathrm{R}_{u s c}$ is $t_{u s c}$.

The challenger $C$ maintains the query lists for consistency.
$L_{0}$ : a tuple of $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right)$.
$L_{1}$ : a tuple of $\left(Y, h_{1}^{i}\right)$.
$L_{2}$ : a tuple of $\left(m, c, R, Y, Q_{i}, Q_{j}, h_{2}^{i}\right)$.
$L_{3}$ : a tuple of $\left(m, c, R, Y, P_{i}, P_{j}, h_{3}^{i}\right)$.
$L_{4}$ : a tuple of $\left(I D_{i}, P_{i}, h_{4}^{i}\right)$.
$L_{C}$ :a tuple of $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$
$L_{s c}$ :a tuple of $\left(m, I D_{i}, I D_{j}, \sigma\right), \sigma=(c, R, S)$

## Lemma 1.

Given an instance of the GDH problem: For unknown $A, B \in Z_{q}^{*}$, by giving $P, A P, B P, P \in$ $E / F p$ and an oracle DDH, compute $A B P$.

Suppose $\mathcal{A}_{1}$ win the Game IND-CCA2 with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the above instance of the GDH problem with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{1}$.

$$
\varepsilon^{\prime}=\frac{2}{q_{c}\left(q_{c}-1\right)} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{d}} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{s k}} \cdot\left[\frac{1}{2}+\frac{1}{2}\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{u s c}}\right] \cdot \varepsilon
$$

$\tau \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+t+t_{C P}$
Proof. To interact with $\mathcal{A}_{1}$, algorithm $\Gamma$ simulates as $C$ and runs the following steps to solve the above instance of the GDH problem with the help of $\mathcal{A}_{1}$.
(C1) $\Gamma$ executes the SETUP algorithm and sends system params to $\mathcal{A}_{1}$.
(C2) Suppose that $\Gamma$ will choose accepted sender $S$ with identity $I D_{S}{ }^{*}$ and accepted receiver $R$ with identity $I D_{R}{ }^{*}$ for challenge in the next step. $\mathcal{A}_{1}$ asks the $\Gamma$ for a polynomial number of the queries.
$\boldsymbol{H}_{\mathbf{0}}$ query: On receiving $\left(I D_{i}, T_{i}, P_{i}\right), \Gamma$ performs as follows:

1) If $L_{0}$ contains a tuple of $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right), \Gamma$ returns $h_{0}^{i}$ to $\mathcal{A}_{1}$.
2) Otherwise,
a) If $i \neq S, R, \Gamma$ randomly chooses $h_{0}^{i}$ and inserts $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right)$ to $L_{0}$ and returns $h_{0}^{i}$ to $\mathcal{A}_{1}$.
b) Otherwise, $\Gamma$ gets $h_{0}^{i}$ from $L_{C}$, inserts $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right)$ to $L_{0}$ and returns $h_{0}^{i}$ to $\mathcal{A}_{1}$.

Create $\left(I D_{i}\right)$ : On receiving $\left(I D_{i}\right), \Gamma$ performs as follows:

1) If $L_{C}$ contains a tuple of $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$.
a) If $i \neq S, R, \Gamma$ returns all the elements of the tuple to $\mathcal{A}_{1}$.
b) Otherwise, $\Gamma$ returns $\left(I D_{i}, \perp, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $\mathcal{A}_{1}$.
2) Otherwise,
a) If $i \neq S, R$, then $\Gamma$ randomly chooses $x_{i}, t_{i}, r_{i}$, computes $P_{i}=x_{i} P, T_{i}=t_{i} P$, asks $H_{0}$ query to get $h_{0}^{i}$, then computes $d_{i}=t_{i}+h_{0}^{i} s, \Gamma$ inserts $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $L_{C}$ and returns $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $\mathcal{A}_{1}$.
b) Otherwise, $\Gamma$ randomly chooses $r_{i}, x_{i}, h_{0}^{i}$, computes $P_{i}=x_{i} P, T_{S}=A P-h_{0}^{S} P_{\text {pub }}$, $T_{R}=B P-h_{0}^{R} P_{\text {pub }}, \Gamma$ inserts $\left(I D_{i}, \perp, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $L_{C}$, inserts $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right)$ to $L_{0}$ and returns $\left(I D_{i}, \perp, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $\mathcal{A}_{1}$.

All the following queries should be asked after Create $\left(I D_{i}\right)$
$\boldsymbol{H}_{\mathbf{1}}$ query: On receiving $(Y), \Gamma$ performs as follows:
If $L_{1}$ contains a tuple of $\left(Y, h_{1}^{i}\right), \Gamma$ returns $h_{1}^{i}$ to $\mathcal{A}_{1}$. Otherwise, $\Gamma$ randomly chooses $h_{1}^{i}$ and inserts $\left(Y, h_{1}^{i}\right)$ to $L_{1}$ and returns $h_{1}^{i}$ to $\mathcal{A}_{1}$.
$\boldsymbol{H}_{\mathbf{2}}$ query: On receiving $\left(m, c, R, Y, Q_{i}, Q_{j}\right), \Gamma$ performs as follows:
If $L_{2}$ contains a tuple of $\left(m, c, R, Y, Q_{i}, Q_{j}, h_{2}^{i}\right), \Gamma$ returns $h_{2}^{i}$ to $\mathcal{A}_{1}$. Otherwise, $\Gamma$ randomly chooses $h_{2}^{i}$ and inserts $\left(m, c, R, Y, Q_{i}, Q_{j}, h_{2}^{i}\right)$ to $L_{2}$ and returns $h_{2}^{i}$ to $\mathcal{A}_{1}$.
$\boldsymbol{H}_{3}$ query: On receiving $\left(m, c, R, Y, P_{i}, P_{j}\right), \Gamma$ performs as follows:
If $L_{3}$ contains a tuple of $\left(m, c, R, Y, P_{i}, P_{j}, h_{3}^{i}\right), \Gamma$ returns $h_{3}^{i}$ to $\mathcal{A}_{1}$. Otherwise, $\Gamma$ randomly chooses $h_{3}^{i}$ and inserts $\left(m, c, R, Y, P_{i}, P_{j}, h_{3}^{i}\right)$ to $L_{3}$ and returns $h_{3}^{i}$ to $\mathcal{A}_{1}$.
$\boldsymbol{H}_{4}$ query: On receiving $\left(I D_{i}, P_{i}\right), \Gamma$ performs as follows:
If $L_{4}$ contains a tuple of $\left(I D_{i}, P_{i}, h_{4}^{i}\right), \Gamma$ returns $h_{4}^{i}$ to $\mathcal{A}_{1}$. Otherwise, $\Gamma$ randomly chooses $h_{4}^{i}$ and inserts $\left(I D_{i}, P_{i}, h_{4}^{i}\right)$ to $L_{4}$ and returns $h_{4}^{i}$ to $\mathcal{A}_{1}$.
$\mathbf{R} \boldsymbol{d}_{i}$ query: On receiving $I D_{i}, \Gamma$ performs as follows:

1) If $i \neq S, R, \Gamma$ returns $d_{i}$ from $L_{C}$ to $\mathcal{A}_{1}$.
2) Otherwise, the game is aborted.
$\mathbf{R} x_{i}$ query:. On receiving $I D_{i}, \Gamma$ returns $x_{i}$ from $L_{C}$ to $\mathcal{A}_{1}$.
$\mathbf{R s k}_{\boldsymbol{i}}$ query: should be asked after Create $\left(I D_{i}\right)$. On receiving $I D_{i}, \Gamma$ performs as follows:
3) If $i \neq S, R, \Gamma$ returns $\left(d_{i}, x_{i}\right)$ from $L_{C}$ to $\mathcal{A}_{1}$.
4) Otherwise, the game is aborted.
$\mathbf{R p} \boldsymbol{k}_{i}$ query: On receiving $I D_{i}$, $\mathcal{A}_{1}$ randomly chooses $x_{i}^{\prime}$, computes $P_{i}^{\prime}=x_{i}^{\prime} P, \Gamma$ updates all the tuples with $x_{i}=x_{i}^{\prime}, P_{i}=P_{i}^{\prime}$.
$\mathbf{R} r_{i}$ query: $\Gamma$ returns $r_{i}$ from $L_{C}$ to $\mathcal{A}_{1}$.
$\mathbf{R}_{\text {sc }}\left(m, I D_{i}, I D_{j}\right)$ query: $\Gamma$ performs as follows:
5) If $i \neq S, R$,

According to the queries Create $\left(I D_{i}\right)$ and Create $\left(I D_{j}\right), \mathcal{A}_{1}$ can get $I D_{i}, d_{i}, x_{i}, r_{i}, I D_{j}, P_{j}, T_{j}$, then $\Gamma$ executes the signcryption algorithm and returns $\left(\sigma=(c, R, S), I D_{i}, I D_{j}\right)$ to $\mathcal{A}_{1}$.
2) If $i=S$ or $i=R, j \neq S, R$,
a) $\mathcal{A}_{1}$ gets $h_{0}^{i}, h_{0}^{j}$ from $L_{0}$, gets $I D_{j}, d_{j}, x_{j}, T_{j}, P_{j}$ from Create $\left(I D_{j}\right)$, gets $I D_{i}, r_{i}, T_{i}, P_{i}$ from Create $\left(I D_{i}\right)$, where $T_{i}=I \cdot P-h_{0}^{i} P_{p u b}$ ( $I=A$ when $i=S, I=B$ when $i=R$ ), gets $h_{4}^{i}, h_{4}^{j}$ from $L_{4}$.
b) Then $\Gamma$ computes $Q_{j}=T_{j}+h_{0}^{j} P_{p u b}, Q_{i}=T_{i}+h_{0}^{i} P_{p u b}=I \cdot P, R=r_{i}\left(h_{4}^{i} Q_{i}+h_{4}^{j} P_{i}\right)$, $Y=R\left(d_{j} h_{4}^{i}+x_{j} h_{4}^{j}\right)$.
c) $\mathcal{A}_{1}$ gets $h_{1}^{i}$ from $L_{1}$.
d) $\Gamma$ computes $c=m \oplus h_{1}^{i}$.
e) $\mathcal{A}_{1}$ gets $h_{2}^{i}$ with ( $m, c, R, Y, Q_{i}, Q_{j}$ ) in $H_{2}$ query.
f) $\Gamma$ randomly chooses $S$, computes $h_{3}^{i}=\frac{S P-R-h_{2}^{i} I \cdot P}{P_{i}}$. If the chosen $S$ and $h_{3}^{i}$ already exist in $L_{s c}$ with $\left(m, I D_{i}, I D_{j},(c, R, S)\right)$ and $L_{3}$, then $\Gamma$ chooses another $S$, computes $h_{3}^{i}$.
g) $\Gamma$ inserts $\left(m, c, R, Y, P_{i}, P_{j}, h_{3}^{i}\right)$ to $L_{3}$ and $\left(m, I D_{i}, I D_{j},(c, R, S)\right)$ to $L_{s c}$, returns $\sigma=(c, R, S)$ to $\mathcal{A}_{1}$.
3) If $i=S, j=R$,
a) $\mathcal{A}_{1}$ gets $h_{0}^{i}, h_{0}^{j}$ from $L_{0}$, gets $I D_{i}, r_{i}, T_{i}, P_{i}, I D_{j}, T_{j}, P_{j}$ from Create $\left(I D_{i}\right)$ and Create $\left(I D_{j}\right)$, where $T_{i}=A \cdot P-h_{0}^{i} P_{p u b}, T_{j}=B \cdot P-h_{0}^{j} P_{p u b}$, gets $h_{4}^{i}, h_{4}^{j}$ from $L_{4}$.
b) Then $\Gamma$ computes $\quad Q_{i}=T_{i}+h_{0}^{i} P_{p u b}=A \cdot P, Q_{j}=T_{j}+h_{0}^{j} P_{p u b}=B \cdot P \quad, \quad R=$ $r_{i}\left(h_{4}^{i} Q_{i}+h_{4}^{j} P_{i}\right)$, randomly chooses $Y$. Since $Y$ is chosen randomly, $\mathcal{A}_{1}$ cannot verify the validity of $c$.

The remaining steps only differ in the step f) with that of the situation above when computing $h_{3}^{i}$ with $h_{3}^{i}=\frac{S P-R-h_{2}^{i} A \cdot P}{P_{i}}$.
$\mathbf{R}_{\text {usc }}\left(\sigma, I D_{i}, I D_{j}\right)$ query:

1) If $i \neq S, R$,

According to the queries Create $\left(I D_{i}\right)$ and Create $\left(I D_{j}\right), \mathcal{A}_{1}$ can get $I D_{i}, d_{i}, x_{i}, r_{i}, I D_{j}, P_{j}, T_{j}$, then $\Gamma$ gets $h_{4}^{i}, h_{4}^{j}$ from $L_{4}$ and computes $Y=r_{i}\left(d_{i} h_{4}^{i}+x_{i} h_{4}^{j}\right)\left(h_{4}^{i} Q_{R}+h_{4}^{j} P_{R}\right), m=$ $c \oplus H_{1}(Y)$, returns $m$ to $\mathcal{A}_{1}$.
2) If $i=S$ or $i=R$ and $j \neq S, R$

According to the queries Create $\left(I D_{i}\right)$ and Create $\left(I D_{j}\right), \mathcal{\mathcal { A } _ { 1 }}$ can get $I D_{i}, P_{i}, T_{i}, I D_{j}, d_{j}, x_{j}$, then $\Gamma$ executes the unsigncryption algorithm and returns $m$ to $\mathcal{A}_{1}$
3) If $\mathrm{i}=\mathrm{S}, j=\mathrm{R}$,
a) if $\left(\sigma, I D_{i}, I D_{j}\right)$ exists in $L_{s c}, \Gamma$ returns $m$ in the list to $\mathcal{A}_{1}$.
b) Otherwise, $\Gamma$ rejects $\mathrm{R}_{u s c}\left(\sigma, I D_{i}, I D_{j}\right)$ query.
$\operatorname{RDDH}(a P, b P, c P)$ query:
The oracle DDH outputs 1 if $a b P=c P$, otherwise 0 .
(C3) The adversary chooses accepted sender $I D_{S}{ }^{*}$, accepted receiver $I D_{R}{ }^{*}$ and $m_{0}, m_{1}$ to ask a challenging. The challenger C performs as follows

1) gets $h_{0}^{S}, h_{0}^{R}, h_{4}^{S}, h_{4}^{R}, I D_{S}, r_{S}, x_{S}, T_{S}, P_{S}, I D_{R}, x_{R}, T_{R}, P_{R}$ from $L_{0}, L_{4}$, Create $\left(I D_{S}\right)$ and Create $\left(I D_{R}\right)$, where $Q_{S}=A \cdot P, Q_{R}=B \cdot P$, computes $R=r_{S}\left(h_{4}^{S} Q_{S}+h_{4}^{R} P_{S}\right)$
2) computes $Y^{*}$ with the candidate solution of $A B P$, gets $h_{1}^{S}$ from $L_{1}$.
3) picks randomly $b \in\{0,1\}$, computes $c^{*}=m_{b} \oplus h_{1}^{S}$.
4) gets $h_{2}^{S}$ from $L_{2}$.
5) randomly chooses $S$, computes $h_{3}^{S}=\frac{S P-R-h_{2}^{S} A \cdot P}{P_{S}}$.
6) inserts $\left(m_{b}, c^{*}, R, Y^{*}, P_{S}, P_{R}, h_{3}^{S}\right)$ to $L_{3}$, returns ( $\left.\sigma^{*}=\left(c^{*}, R, S\right), I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$ to $\mathcal{A}_{1}$.
(C4) The adversary asks queries as done in step (C2), keeping $I D_{S}{ }^{*}$ and $I D_{R}{ }^{*}$ being accepted.
(C5) As $\mathcal{A}_{1}$ win the Game IND-CCA2 by guessing $b^{\prime}=b$ with advantage $\varepsilon$, with the help of $\mathcal{A}_{1}, \Gamma$ can compute $h_{1}^{S}=m_{b} \oplus c^{*}$, get $Y^{*}$ in $L_{1}$, ask RDDH query with $\operatorname{RDDH}\left(R, h_{4}^{S} Q_{R}+h_{4}^{R} P_{R}, Y^{*}\right)=1$, then $\Gamma$ gets $C \cdot P$ with running time of $t_{C P} \approx 4 T_{m u l}+$ $3 T_{\text {add }}$, in which $T_{m u l}$ is the time for one scalar multiplication operation over elliptic curve and $T_{a d d}$ the point addition operation over elliptic curve.

$$
C \cdot P=d_{s} d_{R} \cdot P=\frac{\frac{Y^{*}}{r_{S}}-h_{4}^{S} h_{4}^{R} x_{R} A \cdot P-h_{4}^{S} h_{4}^{R} x_{S} B \cdot P-h_{4}^{R} h_{4}^{R} x_{R} P_{S}}{h_{4}^{S} h_{4}^{S}}
$$

With the above description, $\Gamma$ wins to solve the GDH problem only if when choosing $I D_{S}{ }^{*}$ and $I D_{R}{ }^{*}$ for challenge (i.e. event $E_{1}{ }^{\prime}$ occurs), the game is completed. But, $\Gamma$ will terminate the game when any of the events $E_{1}, E_{2}, E_{3}, E_{4}$ occurs.
$E_{1}: \mathcal{A}_{1}$ does not choose both $S$ with identity of $I D_{S}{ }^{*}$ and $R$ with identity $I D_{R}{ }^{*}$ for challenge.
$E_{2}: \mathcal{A}_{1}$ asks $\mathrm{R} d_{i}$ query with $I D_{S}{ }^{*}$ or $I D_{R}{ }^{*}$,
$\operatorname{Pr}\left[E_{2}\right]=\frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\frac{C_{{q_{c}}^{-2}}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-2}{q_{c}}\right) q_{d} . . . . ~ . ~ . ~}_{q_{d}-1}$
$E_{3}: \mathcal{A}_{1}$ asks Rsk ${ }_{i}$ query with $I D_{S}{ }^{*}$ or $I D_{R}{ }^{*}$,
$\operatorname{Pr}\left[E_{3}\right]=\frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}}}_{q_{s k}-1} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{s k}}$.
$E_{4}: \mathcal{A}_{1}$ asks $\mathrm{R}_{u s c}$ query with $\left(m_{b}, I D_{S}{ }^{*}, I D_{R}{ }^{*}\right)$,

$E_{1}{ }^{\prime}: \mathcal{A}_{1}$ choose both $I D_{S}{ }^{*}$ and $I D_{R}{ }^{*}$ for challenge. $\operatorname{Pr}\left[E_{1}{ }^{\prime}\right]=\frac{1}{C_{q_{c}}^{2}}=\frac{2}{q_{c}\left(q_{c}-1\right)}$.
Then, if $\mathcal{A}_{1}$ win the Game IND-CCA2 with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the GDH problem with advantage $\varepsilon^{\prime}$ by interacting with $\mathcal{A}_{1}$.

$$
\begin{aligned}
\varepsilon^{\prime} & =\operatorname{Pr}\left[E_{1}{ }^{\prime}\right] \cdot\left(1-\operatorname{Pr}\left[E_{2}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E_{3}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E_{4}\right]\right) \cdot \varepsilon \\
& =\frac{2}{q_{c}\left(q_{c}-1\right)} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{d}} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{s k}} \cdot\left[\frac{1}{2}+\frac{1}{2}\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{u s c}}\right] \cdot \varepsilon \\
\tau & \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+t+t_{C P}
\end{aligned}
$$

## Lemma 2.

Suppose $\mathcal{A}_{2}$ win the Game IND-CCA2 with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the instance of the GDH problem in Lemma 1 with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{1}$.

$$
\begin{gathered}
\varepsilon^{\prime}=\frac{2}{q_{c}\left(q_{c}-1\right)} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{s k}} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{x}} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{p k}} \cdot\left[\frac{1}{2}+\frac{1}{2}\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{u s c}}\right] \cdot \varepsilon \\
\tau \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+t+t_{C P}
\end{gathered}
$$

Proof. To interact with $\mathcal{A}_{2}$, algorithm $\Gamma$ runs the following steps to solve the instance of the GDH problem .
(C1) $\Gamma$ executes the SETUP algorithm and sends system params and master secret key $s$ to $\mathcal{A}_{2}$.
(C2) $\mathcal{A}_{2}$ asks $\Gamma$ for a polynomial number of the queries as shown in Lemma 1, $\Gamma$ answers the following queries differently.
$\boldsymbol{H}_{\mathbf{0}}$ query: On receiving $\left(I D_{i}, T_{i}, P_{i}\right), \Gamma$ performs as follows:

1) If $L_{0}$ contains a tuple of $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right), \Gamma$ returns $h_{0}^{i}$ to $\mathcal{A}_{1}$.
2) Otherwise, $\Gamma$ randomly chooses $h_{0}^{i}$ and inserts $\left(I D_{i}, T_{i}, P_{i}, h_{0}^{i}\right)$ to $L_{0}$ and returns $h_{0}^{i}$ to $\mathcal{A}_{1}$.

Create $\left(\boldsymbol{I D}_{\boldsymbol{i}}\right)$ : On receiving $\left(I D_{i}\right), \Gamma$ performs as follows:

1) If $L_{C}$ contains a tuple of $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$.
a) If $i \neq S, R, \Gamma$ returns all the elements of the tuple to $\mathcal{A}_{2}$.
b) Otherwise, $\Gamma$ returns $\left(I D_{i}, d_{i}, \perp, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $\mathcal{A}_{2}$.
2) Otherwise,
a) If $i \neq S, R, \Gamma$ randomly chooses $x_{i}, t_{i}, r_{i}$, computes $P_{i}=x_{i} P, T_{i}=t_{i} P$, asks $H_{0}$ query to get $h_{0}^{i}$, then computes $d_{i}=t_{i}+h_{0}^{i} s, \Gamma$ inserts $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $L_{C}$ and returns $\left(I D_{i}, d_{i}, x_{i}, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $\mathcal{A}_{2}$.
b) Otherwise, $\Gamma$ randomly chooses $t_{i}, r_{i}$, sets $P_{S}=A P, P_{R}=B P$, gets $h_{0}^{i}$ from $L_{0}$, computes $d_{i}=t_{i}+h_{0}^{i} s$, inserts $\left(I D_{i}, d_{i}, \perp, P_{i}, T_{i}, r_{i}, h_{0}^{i}\right)$ to $L_{C}$ and returns ( $I D_{i}, d_{i}, \perp$ , $P_{i}, T_{i}, r_{i}, h_{0}^{i}$ ) to $\mathcal{A}_{2}$.

All the following queries should be asked after Create $\left(I D_{i}\right)$.
$\mathbf{R} \boldsymbol{x}_{i}$ query: On receiving $I D_{i}, \Gamma$ performs as follows:

1) If $i \neq S, R, \Gamma$ returns $x_{i}$ from $L_{C}$ to $\mathcal{A}_{2}$.
2) Otherwise, the game is aborted.
$\mathbf{R d}_{i}$ query: On receiving $I D_{i}, \Gamma$ returns $d_{i}$ from $L_{C}$ to $\mathcal{A}_{2}$.
$\mathbf{R p} \boldsymbol{k}_{\boldsymbol{i}}$ query: On receiving $I D_{i}, \Gamma$ performs as follows:
3) If $i \neq S, R, \mathcal{A}_{2}$ randomly chooses $x_{i}^{\prime}$, computes $P_{i}^{\prime}=x_{i}^{\prime} P, \Gamma$ updates all the tuples with $x_{i}=x_{i}^{\prime}, P_{i}=P_{i}^{\prime}$
4) Otherwise, the game is aborted.
$\mathbf{R}_{s c}\left(m, I D_{i}, I D_{j}\right)$ query: $\Gamma$ performs the same steps as shown in Lemma $\mathbf{1}$ except the following steps.
5) If $i \neq S, R, \Gamma$ executes the same steps as shown in Lemma 1.
6) If $i=S$ or $i=R, j \neq S, R$,
a) $\mathcal{A}_{2}$ gets $h_{0}^{i}, h_{0}^{j}$ from $L_{0}$, gets $I D_{j}, d_{j}, x_{j}, T_{j}, P_{j}$ from Create $\left(I D_{j}\right)$, gets $I D_{i}, r_{i}, T_{i}, P_{i}$ from Create $\left(I D_{i}\right)$, where $P_{i}=I \cdot P(I=A$ when $i=S, I=B$ when $i=R)$, gets $h_{4}^{i}, h_{4}^{j}$ from $L_{4}$.
b) Then $\Gamma$ computes $Q_{i}=T_{i}+h_{0}^{i} P_{p u b}, Q_{j}=T_{j}+h_{0}^{j} P_{p u b}, \quad R=r_{i}\left(h_{4}^{i} Q_{i}+h_{4}^{j} \cdot I \cdot P\right)$, $Y=R\left(d_{j} h_{4}^{i}+x_{j} h_{4}^{j}\right)$.
f) computes $h_{3}^{i}$ with $h_{3}^{i}=\frac{S P-R-h_{2}^{i} Q_{i}}{I \cdot P}$
7) If $i=S, j=R$,
a) $\mathcal{A}_{2}$ gets $h_{0}^{i}, h_{0}^{j}$ from $L_{0}$, gets $I D_{i}, r_{i}, T_{i}, P_{i}, I D_{j}, T_{j}, P_{j}$ from Create $\left(I D_{i}\right)$ and Create $\left(I D_{j}\right)$, where $P_{i}=A \cdot P, P_{j}=B \cdot P$, gets $h_{4}^{i}, h_{4}^{j}$ from $L_{4}$.
b) Then $\Gamma$ computes $Q_{i}=T_{i}+h_{0}^{i} P_{p u b}, Q_{j}=T_{j}+h_{0}^{j} P_{p u b}, R=r_{i}\left(h_{4}^{i} Q_{i}+h_{4}^{j} \cdot A \cdot P\right)$, randomly chooses $Y$.
f) computes $h_{3}^{i}$ with $h_{3}^{i}=\frac{S P-R-h_{2}^{i} Q_{i}}{A \cdot P}$.
(C3) $\Gamma$ executes the same steps as (C3) shown in Lemma 1 except the following steps.
8) $\mathcal{A}_{2}$ gets $h_{0}^{S}, h_{0}^{R}$ from $L_{0}$, gets $I D_{S}, r_{S}, d_{S}, T_{S}, P_{S}, I D_{R}, T_{R}, P_{R}$ from Create $\left(I D_{S}\right)$ and Create $\left(I D_{R}\right)$, where $P_{S}=A \cdot P, P_{R}=B \cdot P$, gets $h_{4}^{S}, h_{4}^{R}$ from $L_{4}$, computes $Q_{S}=T_{S}+$ $h_{0}^{S} P_{p u b}, Q_{R}=T_{R}+h_{0}^{R} P_{\text {pub }}, R=r_{S}\left(h_{4}^{S} Q_{S}+h_{4}^{R} P_{S}\right)$.
9) computes $h_{3}^{S}=\frac{S P-R-h_{2}^{S} Q_{S}}{A \cdot P}$
(C4) The adversary asks queries as done in step (C2), keeping $I D_{S}{ }^{*}$ and $I D_{R}{ }^{*}$ being accepted.
(C5) As $\mathcal{A}_{2}$ win the Game IND-CCA2 by guessing $b^{\prime}=b$ with advantage $\varepsilon$, then $\Gamma$ can compute $h_{1}^{S}=m_{b} \oplus c^{*}$, get $Y^{*}$ in $L_{1}$, ask RDDH query with $\operatorname{RDDH}\left(R, h_{4}^{S} Q_{R}+h_{4}^{R} P_{R}, Y^{*}\right)=1$, then $\Gamma$ gets $C \cdot P$ with running time of $t_{C P} \approx 4 T_{m u l}+3 T_{m u l}$.

$$
C \cdot P=x_{S} x_{R} \cdot P=\frac{\frac{Y^{*}}{r_{S}}-h_{4}^{S} h_{4}^{S} d_{R} Q_{S}-h_{4}^{S} h_{4}^{R} d_{R} A \cdot P-d_{S} h_{4}^{S} h_{4}^{R} B \cdot P}{h_{4}^{R} h_{4}^{R}}
$$

When event $E_{1}{ }^{\prime}$ occurs, $\Gamma$ will terminate the game when any of the events $E_{1}, E_{3}, E_{4}, E_{5}, E_{6}$ occurs.
$E_{5}: \mathcal{A}_{2}$ asks $\mathrm{R} x_{i}$ query with $I D_{S}{ }^{*}$ or $I D_{R}{ }^{*}$,
$\operatorname{Pr}\left[E_{5}\right]=\frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c_{c}-2}}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}}}_{q_{x}-1} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{x}}$.
$E_{6}: \mathcal{A}_{2}$ asks Rpk $k_{i}$ query with $I D_{S}{ }^{*}$ or $I D_{R}{ }^{*}$,
$\operatorname{Pr}\left[E_{6}\right]=\frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-2}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{2}^{1}}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{p k}} . . . . . . . . . .}_{q_{p k}-1}$

Then, if $\mathcal{A}_{2}$ win the Game IND-CCA2 with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the GDH problem with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{2}$.

$$
\begin{aligned}
& \left.\varepsilon^{\prime}=\operatorname{Pr}\left[E_{1}{ }^{\prime}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E_{3}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E_{4}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E_{5}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E_{6}\right]\right) \cdot \varepsilon \\
& =\frac{2}{q_{c}\left(q_{c}-1\right)} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{s k}} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{x}} \cdot\left(\frac{q_{c}-2}{q_{c}}\right)^{q_{p k}} \cdot\left[\frac{1}{2}+\frac{1}{2}\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{u s c}}\right] \cdot \varepsilon \\
\tau & \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+t+t_{C P}
\end{aligned}
$$

According to Lemma1 and Lemma 2, if $\mathcal{A}$ win the Game IND-CCA2 in polynomial time, $\Gamma$ can solve the GDH problem, which is contradictory with the security assumption of GDH problem. Then, we conclude that $\mathcal{A}$ cannot win the Game IND-CCA2 and $I N D_{-} A d v_{A}(k)$ is negligible. Therefore, our scheme can provide confidentiality under the GDH assumption.

Theorem 3 Our scheme provides unforgeability under the DL problem.
This theorem can be derived from the Lemma3 and Lemma 4.

## Lemma 3

Given an instance of the DL problem: For unknown $A \in Z_{q}^{*}$, by giving $A P, P \in E / F p$, compute $A$.

Suppose $\mathcal{A}_{1}$ win the Game EUF-CMA with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the above instance of the DL problem with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{1}$.
$\varepsilon^{\prime}=\frac{1}{q_{c}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{d}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{s k}} \cdot\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{s c}} \cdot \frac{1}{\sqrt{q_{2}}} \cdot \varepsilon$
$\tau \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+2 t+t_{d s}$
Proof. To interact with $\mathcal{A}_{1}$, algorithm $\Gamma$ simulates as $C$ and runs the following steps to solve the above instance of the DL problem with the help of $\mathcal{A}_{1}$.
(U1) $\Gamma$ executes the SETUP algorithm and sends system params to $\mathcal{A}_{1}$.
(U2) Suppose that $\Gamma$ will choose accepted sender $S$ with identity $I D_{S}{ }^{*}$ and a user $I D_{j}{ }^{*}$ for challenge. $\mathcal{A}_{1}$ asks the $\Gamma$ for a polynomial number of the queries as shown in Lemma 1. Queries only contains conditions of $i \neq S$ and $i=S$, where receiver $R$ should not be considered and specified.
(U3) The adversary $\mathcal{A}_{1}$ chooses accepted sender $I D_{S}{ }^{*}$ and a user $I D_{j}{ }^{*}$, outputs $\sigma^{*}$ on a chosen messages $m^{*}$ where $\sigma^{*}=\left(c^{*}, R^{*}, S^{*}\right)$.
(U4) C executes unsigncryption algorithm with input as $\left(\sigma^{*}, I D_{S}{ }^{*}, I D_{j}{ }^{*}\right)$. If C outputs $m=m^{*}, \mathcal{A}_{1}$ wins the game.

Suppose $\mathcal{A}_{1}$ win the Game EUF-CMA, then $S^{*}=r_{S}\left(d_{S} h_{4}^{S}+x_{S} h_{4}^{j}\right)+d_{S} H^{*}+$ $x_{S} J^{*}, \quad H^{*}=h_{2}^{S *}\left(m^{*}, c^{*}, R^{*}, Y, Q_{S}, Q_{j}\right), J^{*}=h_{3}^{S *}\left(m^{*}, c^{*}, R^{*}, Y, P_{S}, P_{j}\right), \quad R^{*}=r_{S}\left(d_{S} h_{4}^{S}+\right.$ $\left.x_{S} h_{4}^{j}\right) P$. Based on the forking lemma[24], $\mathcal{A}_{1}$ can get another valid signcryption $\left(\sigma^{* *}, I D_{S}{ }^{*}, I D_{j}^{*}\right)$ on $m^{*}$ according to replay attack with rearrangement in $L_{2}$ and $L_{3}$. According to the birthday paradox, C may return two different hash values associated with the same input when answering a Hash query. Such successful birthday attack occurs with the probability of $\operatorname{Pr}\left[\right.$ forking_ $\left.H_{2}\right]=\frac{1}{\sqrt{q_{2}}}$ for $H_{2}$ query and $\operatorname{Pr}\left[\right.$ forking_ $\left.H_{3}\right]=\frac{1}{\sqrt{q_{3}}}$ for $H_{3}$ query.

We get $\sigma^{* *}=\left(c^{*}, R^{*}, S^{* *}\right), S^{* *}=r_{S}\left(d_{S} h_{4}^{S}+x_{S} h_{4}^{j}\right)+d_{S} H^{* *}+x_{S} J^{* *}$

$$
\begin{gathered}
S^{*} P=R^{*}+d_{S} H^{*} P+x_{S} J^{*} P \\
S^{* *} P=R^{*}+d_{S} H^{* *} P+x_{S} J^{* *} P
\end{gathered}
$$

According to above expressions, we get $A=d_{S}=\frac{S^{* *}-S^{*}+x_{S} J^{*}-x_{S} J^{* *}}{H^{* *}-H^{*}},\left(H^{* *} \neq H^{*}\right)$, from which, we conclude that $\Gamma$ may solve the DL problem if successful birthday attack on $\mathrm{H}_{2}$ occurs. Failure birthday attack on $H_{3}$ will generate $J^{* *}=J^{*}$, which does not affect the solution of the DL problem. The running time to compute $d_{S}$ is $t_{d s} \approx 3 T_{m s z}$, in which $T_{m s z}$ is the time for one scalar multiplication operation over $Z_{q}^{*}$.

With the above description, $\Gamma$ wins to solve the DL problem only if when choosing $I D_{S}{ }^{*}$ for challenge, successful birthday attack on $H_{2}$ occurs and the game is completed. But, $\Gamma$ will terminate the game when any of the events $E U_{1}, E U_{2}, E U_{3}, E U_{4}, E U_{5}$ occurs.
$E U_{1}: \mathcal{A}_{1}$ does not choose $\left(I D_{S}{ }^{*}, *\right)$ for challeng, $\operatorname{Pr}\left[E U_{1}\right]=\frac{C_{q_{c-1}}^{1}}{C_{q_{c}}^{1}}$.
$E U_{2}: \mathcal{A}_{1}$ asks $\mathrm{R} d_{i}$ query with $I D_{S}{ }^{*}$,
$\operatorname{Pr}\left[E U_{2}\right]=\frac{1}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{1}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}}}_{q_{d}-1} \cdot \frac{1}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{d}}$.
$E U_{3}: \mathcal{A}_{1}$ asks Rsk ${ }_{i}$ query with $I D_{S}{ }^{*}$,
$\operatorname{Pr}\left[E U_{3}\right]=\frac{1}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{1}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}}}_{q_{s k}-1} \cdot \frac{1}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{s k}}$.
$E U_{4}: \mathcal{A}_{1}$ asks $\mathrm{R}_{s c}$ query with $\left(m^{*}, I D_{S}{ }^{*}, I D_{j}{ }^{*}\right)$,
$\operatorname{Pr}\left[E U_{4}\right]=[\frac{1}{2^{k}}+\left(1-\frac{1}{2^{k}}\right) \cdot \frac{1}{2^{k}}+\cdots+\underbrace{\left.\left(1-\frac{1}{2^{k}}\right) \cdot\left(1-\frac{1}{2^{k}}\right) \cdot \ldots \cdot\left(1-\frac{1}{2^{k}}\right) \cdot \frac{1}{2^{k}}\right]=1-\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{s c}}, ~(1) ~}_{a_{s c}-1}$
$E U_{5}: \mathcal{A}_{1}$ fails to use oracle $H_{2}$ and replay technique to generate one more valid ciphertext. $\operatorname{Pr}\left[E U_{5}\right]=1-\operatorname{Pr}\left[\right.$ forking_ $H_{2}$ ].

Then, $\mathcal{A}_{1}$ will win the Game EUF-CMA with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the DL problem with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{1}$.

$$
\begin{aligned}
\varepsilon^{\prime} & =\left(1-\operatorname{Pr}\left[E U_{1}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{2}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{3}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{4}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{5}\right]\right) \cdot \varepsilon \\
& =\frac{1}{q_{c}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{d}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{s k}} \cdot\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{s c}} \cdot \frac{1}{\sqrt{q_{2}}} \cdot \varepsilon \\
\tau & \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+2 t+t_{d s}
\end{aligned}
$$

## Lemma 4.

Suppose $\mathcal{A}_{2}$ win the Game EUF-CMA with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the instance of the DL problem in Lemma $\mathbf{3}$ with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{2}$.
$\varepsilon^{\prime}=\frac{1}{q_{c}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{s k}} \cdot\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{s c}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{x}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{p k}} \cdot \frac{1}{\sqrt{q_{3}}} \cdot \varepsilon$
$\tau \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+2 t+t_{x s}$
Proof. To interact with $\mathcal{A}_{2}$, algorithm $\Gamma$ runs the following steps to solve the instance of the DL problem .
(U1) $\Gamma$ executes the SETUP algorithm and sends system params and master secret key $s$ to $\mathcal{A}_{2}$.
(U2) Suppose that $\Gamma$ will choose accepted sender $S$ with identity $I D_{S}{ }^{*}$ and a user $I D_{j}{ }^{*}$ for challenge. $\mathcal{A}_{2}$ asks the $\Gamma$ for a polynomial number of the queries as shown in Lemma 2. Queries only contains conditions of $i \neq S$ and $i=S$, where receiver $R$ should not be considered and specified.
(U3)(U4) steps are the same as that in Lemma 3.
$\mathcal{A}_{2}$ will get $A=x_{S}=\frac{S^{* *}-S^{*}+d_{S} H^{*}-d_{S} H^{* *}}{J^{* *}-J^{*}}, J^{* *} \neq J^{*}$, from which, we conclude that $\Gamma$ may solve the DL problem if successful birthday attack on $H_{3}$ occurs. Failure birthday attack on $H_{2}$ will generate $H^{* *}=H^{*}$, which does not affect the solution of the DL problem. The running time to compute $x_{S}$ is $t_{x s} \approx 3 T_{m s z}$.
$\Gamma$ will terminate the game when any of the events $E U_{1}, E U_{3}, E U_{4}, E U_{6}, E U_{7}, E U_{8}$ occurs. $E U_{6}: \mathcal{A}_{2}$ asks R $x_{i}$ query with $I D_{S}{ }^{*}$,
$\operatorname{Pr}\left[E U_{6}\right]=\frac{1}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{1}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{1}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{x}},{ }^{2}}_{q_{x}-1}$
$E U_{7}: \mathcal{A}_{2}$ asks Rpk ${ }_{i}$ query with $I D_{S}{ }^{*}$,
$\operatorname{Pr}\left[E U_{7}\right]=\frac{1}{C_{q_{c}}^{1}}+\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{1}{C_{q_{c}}^{1}}+\cdots+\underbrace{\frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}} \cdot \ldots \cdot \frac{C_{q_{c}-1}^{1}}{C_{q_{c}}^{1}}}_{q_{p k}-1} \cdot \frac{1}{C_{q_{c}}^{1}}=1-\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{p k}}$
$E U_{8}: \mathcal{A}_{2}$ fails to use oracle $H_{3}$ and replay technique to generate one more valid ciphertext. $\operatorname{Pr}\left[E U_{8}\right]=1-\operatorname{Pr}\left[\right.$ forking_ $\left.H_{3}\right]$.

Similarly, $\mathcal{A}_{2}$ will win the Game EUF-CMA with advantage $\varepsilon$ and running time $t$, then an algorithm $\Gamma$ can be constructed to solve the DL problem with advantage $\varepsilon^{\prime}$ and running time $\tau$ by interacting with $\mathcal{A}_{2}$.
$\varepsilon^{\prime}=\left(1-\operatorname{Pr}\left[E U_{1}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{3}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{4}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{6}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{7}\right]\right) \cdot\left(1-\operatorname{Pr}\left[E U_{8}\right]\right) \cdot \varepsilon$
$=\frac{1}{q_{c}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{s k}} \cdot\left(\frac{2^{k}-1}{2^{k}}\right)^{q_{s c}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{x}} \cdot\left(\frac{q_{c}-1}{q_{c}}\right)^{q_{p k}} \cdot \frac{1}{\sqrt{q_{3}}} \cdot \varepsilon$
$\tau \leq \sum_{i=0}^{4} q_{i} t_{i}+q_{c} t_{c}+q_{d} t_{d}+q_{x} t_{x}+q_{p k} t_{p k}+q_{r} t_{r}+q_{s c} t_{s c}+q_{u s c} t_{u s c}+2 t+t_{x s}$
According to Lemma 3 and Lemma 4, if $\mathcal{A}$ win the Game EUF-CMA in polynomial time, $\Gamma$ can solve the DL problem, which is contradictory with the security assumption of DL problem. Then, we conclude that $\mathcal{A}$ cannot win the Game EUF-CMA and $E U F_{-} A d v_{A}(k)$ is negligible. Therefore, our scheme can provide unforgeability under the DL problem.

In light of the proof above, our proposed scheme can also resist the PKR attack, MPK attack and ESL attack.

### 5.2. Efficiency analysis

In this section, we evaluates our proposed scheme compared with other related ones. Table 3 lists the computation time cost for referred cryptographic operations from research works [25, 26] and the lengths of parameters. Besides, time for hash and xor operations are trivial and can be neglected in the comparison. Table 4 shows the efficiency of our scheme compared with related ones. Symbol $\sqrt{ }$ denotes that the scheme supports the corresponding character
while $\times$ denotes not.

Table 3. Notation in efficiency

| Notation | Description | cost | Notation | Description |
| :---: | :---: | :---: | :---: | :---: |
| $T_{m u l}$ | One scalar multiplication <br> operation over elliptic curve | 2.21 ms | $\|m\|$ | length of message $m$ |
| $T_{p}$ | One pairing operation in <br> group | 20.04 ms | $\|P\|$ | the size of an element <br> in $G$ |
| $T_{\text {exp }}$ | modular exponentiation in a <br> cyclic group | 5.31 ms | $\|r\|$ | the size of an element <br> in finite field $Z_{q}^{*}$ |
| $T_{m}$ | Modular multiplication | $1 T_{m u l} \approx 1200 T_{m}$ |  |  |

Table 4. Efficiency comparison among related CLSC scheme

| Sch eme | Efficiency |  |  | Supported features |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Communication cost | Computation cost |  | Unfo rgeab ility | Confi denti ality | ESL attack | PKR attack | MPK <br> attack |
|  |  | $\begin{gathered} \hline \text { signcryptio } \\ n \\ \hline \hline \end{gathered}$ | unsigncry ption |  |  |  |  |  |
| [10] | $\|m\|+\|P\|+\|r\|$ | $T p+5 T_{\text {mul }}$ | $\begin{gathered} 5 T p+2 \\ T_{m u l} \\ \hline \end{gathered}$ | $\sqrt{ }$ | $\sqrt{ }$ | $\sqrt{ }$ | $\sqrt{ }$ | $\sqrt{ }$ |
| [11] | $\|P\|+\|r\|$ | $\begin{gathered} T p+T_{\text {exp }}+ \\ 2 T_{\text {mul }} \\ \hline \end{gathered}$ | $\begin{gathered} 5 T p+ \\ 2 T_{\text {mul }} \end{gathered}$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| [12] | $\|m\|+2\|P\|$ | $\begin{gathered} T p+T_{\text {exp }}+ \\ 4 T_{\text {mul }} \\ \hline \end{gathered}$ | $5 T p+T_{\text {mul }}$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| [13] | $\|m\|+\|P\|+2\|r\|$ | $T p+3 T_{\text {mul }}$ | $\begin{gathered} \hline 3 T p+ \\ 3 T_{\text {mul }} \\ \hline \end{gathered}$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| [16] | $\|m\|+4\|r\|$ | $5 T_{\text {exp }}$ | $7 \mathrm{~T}_{\text {exp }}$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| [22] | $\|m\|+2\|r\|$ | $3 \mathrm{~T}_{\text {exp }}$ | $5 \mathrm{~T}_{\text {exp }}$ | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ |
| ours | $\|m\|+\|P\|+\|r\|$ | $3 T_{\text {mul }}+4 T_{m}$ | $5 T_{\text {mul }}$ | $\sqrt{ }$ | $\sqrt{ }$ | $\sqrt{ }$ | $\sqrt{ }$ | $\sqrt{ }$ |

## 6. Conclusions

In this paper, we demonstrate the security weakness of several existing CLSC schemes, and present a CLSC scheme without pairing based on elliptic curve cryptosystem (ECC). Security proof shows that our scheme is secure to provide confidentiality and unforgeability resting on Gap Diffie-Hellman (GDH) assumption and discrete logarithm problem in the random oracle model. Compared with related CLSC schemes, the security and efficiency analysis show that our scheme satisfies more security characters with lowest time cost and slight higher communication cost.
