개성진사진딧물(*Periphyllus allogenae* Szelegiewicz, 1981) (노린재목: 진딧물과: 털진딧물아과)에 대한 알려지지 않은 형태 보고

고준혁 · 이원훈^{1*}경상국립대학교 식물의학과, ¹경상국립대학교 농업생명과학연구원

ABSTRACT: To date, *Periphyllus allogenae* is known only in Korean peninsula, has been reported with morphological characteristics about only the aptera viviparous generation. In this study, we collected fundatrix and alate viviparous female individuals of *P. allogenae* samples from Gapyeong-gun, and Hongcheon-gun in Korea between 2021 and 2022. Herein, we provide new descriptions, measurements, distributions, host plants, and photographs of unknown morphs, fundatrix and alate viviparous generations of *P. allogenae*.

Key words: *Periphyllus allogenae*, Chaitophorinae, fundatrix, alate viviparous female, Korea

초록: 현재까지 전세계적으로 *Periphyllus allogenae* (개성진사진딧물)은 무시성충세대에 대한 형태학적 정보만이 보고되었다. 본 연구에서는 2021년부터 2022년까지 한국 가평군, 홍천군에서 그동안 *P. allogenae*의 알려지지 않았던 간모, 유시성충 세대를 채집하여, 이들에 대하여 형태학적 정보, 분포지역, 기주식물, 생태 사진을 처음으로 보고한다.

검색어: 개성진사진딧물, 털진딧물아과, 간모, 유시성충, 한국

Periphyllus allogenae Szelegiewicz, 1981 is an insect pest that exclusively damages *Acer triflorum* and its distribution is only recorded in Korea. To date, aptera viviparous generation of *P. allogenae* has been described worldwide (Szelegiewicz, 1981).

The genus *Periphyllus* is a highly polymorphic group comprising 52 monoecious and holocyclic species worldwide; however, not all morphs of *Periphyllus* spp. have been identified (Blackman and Eastop, 2022; Sugimoto, 2013; Wieczorek

et al., 2017). For example, fundatrix generations have only been reported in approximately 10 *Periphyllus* species, and alate viviparous female generations have only been reported in approximately 31 species worldwide (Blackman and Eastop 2022; Essig and Abernathy, 1952; Lubiarz and Mackoś-Iwaszko, 2015). Recently, oviparous female and alate male generations of *Periphyllus koeleruteriae* have been identified (Junkiert and Wieczorek, 2019). However, before 2019, only apterous viviparous females, alate viviparous females, and aestivating nymph generation of *P. koeleruteriae* were described (Essig and Abernathy, 1952).

Identification of unknown morphs and knowledge of their life cycle type are important for effective control measures. In

this study, the fundatrix and alate viviparous generations of *P. allogenae* are newly described, and their distribution, host plants, and photographs are also presented.

Materials and Methods

Samples of *P. allogenae* were collected from *Acer triflorum* Kom, 1901. Samples were preserved in 95% ethanol and mounted on Canada balsam following the method described by Blackman and Eastop (2000). Images and measurements were taken using LEICA (DM3000 LED) and LEICA (CTR6 LED). Live specimens were obtained using NICON D 850. All specimens were deposited at the Institute of Agriculture and Life Sciences, Gyeongsang National University.

The following abbreviations are used for morphological features in this study: BL, body length from the head to the end of cauda; BW, body width across abdomen; Ant.I-VI, antennal segments; BD.III, basal articular diameter of Ant.III; Ant.VIb, antennal segment base of Ant.VI; PT, processus terminalis; LS Ant.III, length of the longest seta of Ant.III; LS HEAD, length of the longest seta of head; URS, Ultimate rostrum segment; HT.I, first tarsal segment of hind leg; HT.II, second tarsal segment of hind leg; HTB, Hind Tibia; FEMORA, hind femur; ABDT, abdominal tergite; ABDT.I-VI, length of the longest seta of Abdominal tergite I-VI, respectively; ABDT.VII-VIII, length of the longest seta of Abdominal tergite VII-VIII, respectively; and SIPH, Siphunculi. Following abbreviations are used for the provinces: GW, Gangwon; GG, Gyeonggi; JB, Jeonbuk; JJ, Jeonju; HC, Hongcheon; and GP, Gapyeong.

Taxonomic Accounts

Periphyllus allogenae (Szelegiewicz, 1981)(Figs. 1-3; Table 1)

Periphyllus allogenae Szelegiewicz, 1981: 37

Periphyllus triflorumi Lee and Seo, 1992: 254, 262.

Fundatrix (based on three specimens) (Figs. 1, 3A; Table 1)

Colour. In life: Whole body dark, ABDT.I-III dark red; In mounted specimens: Head, Ant.III basal-middle part pale, Ant.I-III, apical part of Ant.VI, SIPH, genital plate, cauda,

whole leg dark black; ABDT variably sclerites. **Morphological characters.** Body oval and large 2.787-3.250 mm (Fig. 1A), BW 1.689-1.955 mm; Head flat, HW 0.595-0.640 mm (Fig. 1B), dorsum head with 8-10 pairs setae, LS HEAD 0.141-0.189 mm; Antenna 1.282-1.481 mm (Fig. 1C), 0.451-0.455 × BL, 0.757-0.759 × BW, Ant.I 0.101-0.106 mm with 6-9 setae, Ant.II 0.078-0.094 mm with 3-4 setae, Ant.III 0.434-0.529 mm with 11-15 setae, Ant.IV 0.248-0.250 mm with 4-5 setae, Ant.V 0.212-0.231 mm with 1-4 setae, BASE 0.139-0.166 mm with one seta, PT 0.070-0.105 mm, Ant.VIb clearly longer than PT, PT 0.503-0.632 × BASE, LS Ant.III 0.128-0.171 mm, 3.764-4.384 × BD.III; Whole legs pointed, long and numerous setae; FEMORA 0.675-0.779 mm; HTB 1.184-1.306 mm (Fig. 1D) with rows of spinules to apical part; HT.I 0.060-0.069 mm with first tarsal chaetotaxy 6:6:6; HT.II 0.179-0.190 mm; URS 0.129-0.142 mm (Fig. 1E), reaching middle coxae, 0.720-0.747

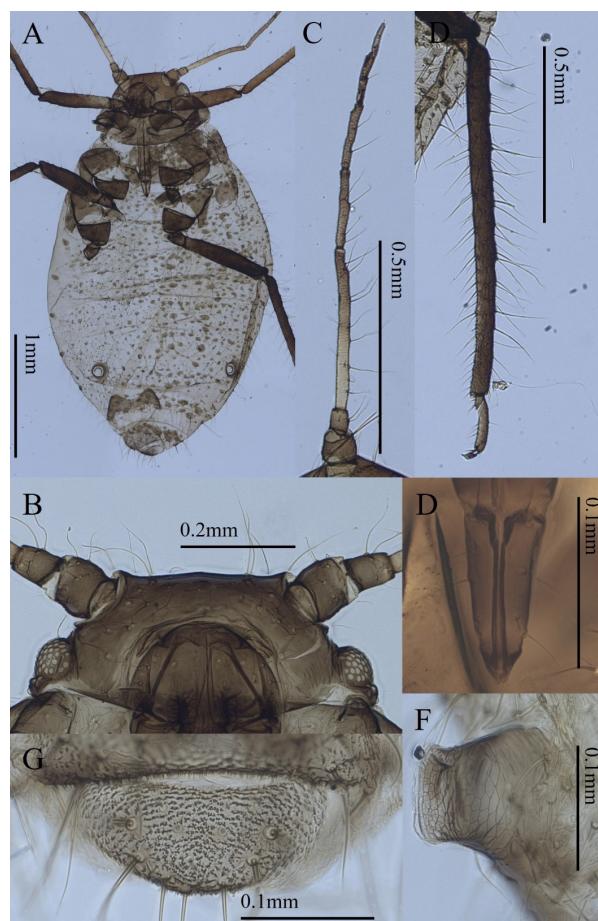

Fig. 1. *Periphyllus allogenae* fundatrix: A, Whole body; B, Head; C, Antenna, D, URS; E, HTB; F, SIPH; G, Cauda.

\times HT.II with 3-4 pairs setae; ABDT variably developed spinal, pleural, and marginal sclerite part with pointed, short and numerous setae, stout and longest setae in ABDT.I-VI 0.221-0.254 mm, ABDT.VI between with 56-71 setae; Stout and longest setae in ABDT.VII-VIII 0.228-0.265 mm; SIPH (Fig. 1F) length 0.077-0.109 mm, SIPH width 0.142-0.218 mm, SIPH width longer than SIPH length, SIPH with rows of reticulation, clearly developed whole part; Cauda width 0.183-0.233 mm (Fig. 1G), in generally rounded with 15-24 setae.

**Alate viviparous female (based on six specimens)
(Figs. 2, 3C; Table 1)**

Colour. In life: ABDT dark red; thorax, whole leg, head and Ant.I-VI black; wing vein brown. In mounted specimens: head, whole antenna, thorax, SIPH, genital plate, cauda, whole leg dark brown; wing vein brown. *Morphological characters.*

Body elongate and large 2.259-2.873 mm (Fig. 3A), BW 1.018-1.306 mm; Head flat, HW 0.509-0.574 mm (Fig. 3B), dorsum head with 9-13 pairs setae, LS HEAD 0.135-0.186 mm; thorax sclerotized; Antenna 1.423-1.714 mm (Fig. 3C), 0.596-0.629 \times BL, 1.312-1.397 \times BW, Ant.I 0.074-0.096 mm with 6-9 setae, Ant.II 0.064-0.077 mm with 3-4 setae, Ant.III 0.526-0.631 mm with 8-18 setae and 26-34 secondary rhinaria, Ant.IV 0.238-0.303 mm with 4-8 setae and 6-10 secondary rhinaria, Ant.V 0.220-0.245 mm with 2-5 setae, Ant.VIb 0.154-0.172 mm with 1-2 setae, PT 0.147-0.190 mm, PT slightly longer than Ant. VIb, PT 0.954-1.105 \times BASE, LS ANT.III 0.128-0.146 mm, 4.294-4.413 \times BD.III; Whole legs pointed, long setae; FEMORA 0.628-0.771 mm; HTB 1.177-1.365 mm (Fig. 3D) with rows of spinules to apical part; HT.I 0.049-0.067 mm with first tarsal chaetotaxy 7:7:6; HT.II 0.184-0.199 mm; URS (Fig. 3E) 0.118-0.143 mm, slightly reaching the middle coxae, 0.641-0.718 \times HT.II with 2-3 pairs setae; ABDT spinal and pleural sclerite
